1 Guiding Principles of the National Energy Policy

The Government of SVG recognizes that energy plays a major role in the diversification efforts of the country's economy and in the pursuit of poverty reduction;

The following guiding principles have been considered during the preparation of the National Energy Policy for St. Vincent and the Grenadines (SVG):

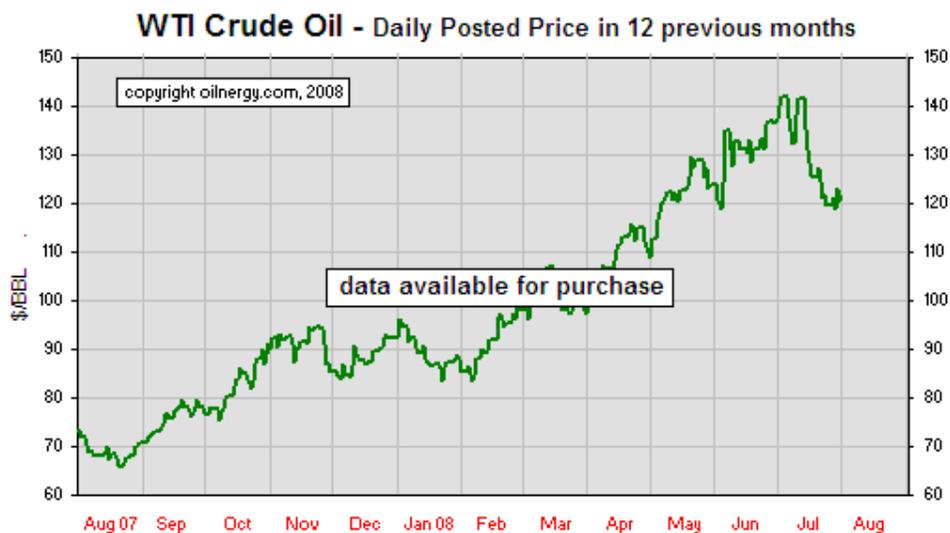

- Guarantee a clean, reliable and affordable energy supply to customers;
- Strengthen the national economy by reducing the dependence on import of fossil fuels;
- Stabilize and possibly reduce the energy consumption per capita in the medium and long term;
- Reduce the dependence on import of energy through continued and expanded exploitation of indigenous resources and improvement of energy efficiency and/or conservation of energy use;
- Liberalize the energy market by encouraging and accommodating private sector participation in energy development and energy services, thereby enhancing competitiveness and engendering lower prices;
- Take advantage of renewable, local energy resources, wherever this is possible from the aspects of availability (potential), energy demand, technical and social implications, economic feasibility, ecological harmony and sustainability;
- To always encourage and stimulate the efficient use of all energy resources, keeping in mind that all types of energy are either scarce or need significant amounts of capital to be tapped or transposed into applicable forms of energy use;
- In all its decision making with respect to energy services development, the Government will strongly promote the active participation of the energy sector, the general public, NGOs, etc.
- In delivering energy services, government will minimise subsidies to consumers and set prices and tariffs in such in way that they timely reflect full cost but taking into account ways to relieve the price burden on the lowest income households;
- Take advantage of national expertise and know-how as far as possible for the development and delivery of energy services. Where importation of resources is required, provide incentives for the use of the most available technology;
- Ensure that the measures taken in pursuing this energy policy is in line with the requirements and legal implications of the Caribbean Single Market Economy (CSME).

2 Rationale for a National Energy Policy

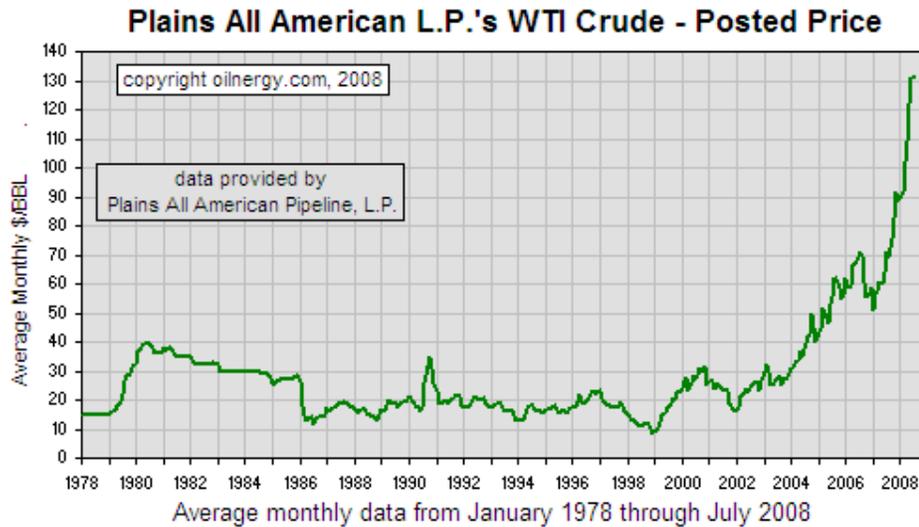

2.1 Global perspective

1. Average world oil prices in every year since 2003 have been higher than the average for the previous year. Prices in 2007 were nearly double the 2003 prices in real terms. Prices rose further into the third quarter of 2008, peaking at \$147 per barrel in mid-July, when they were well above the historical inflation-adjusted record price for a barrel of oil set in the early 1980s.

2. The spot price of WTI¹ crude oil increased from US\$122 per barrel in June 2008 to US\$145 per barrel in July 2008, in part because of perceptions of tenuous supply in several of the major exporting countries, By August 2008, the price fell back to less than US\$120 per barrel. WTI prices, which averaged US\$72 per barrel in 2007, are projected to average US\$119 per barrel in 2008 and US\$124 per barrel in 2009.

¹ WTI – West Texas Intermediate, type of crude oil that is used as benchmark for oil pricing.

3. A variety of factors have caused oil prices to increase, including strong demand growth in non-OECD Asia and the Middle East, no growth in production since 2005 from the members of the Organization of the Petroleum Exporting Countries (OPEC), rising costs for oil exploration and development, across-the-board increases in commodity prices, and a weaker U.S. dollar.

4. The 2006 edition of International Energy Outlook² and World Energy Outlook project that by the year 2030 total primary energy demand will increase by over 50%. In particular, increased international demand for oil and natural gas is directly attributable to burgeoning consumption in countries like China and India, where the use of oil and gas has increased at an average rate of 8% per annum over the last three years. The International Energy Agency (IEA) expects global demand for oil to grow by 41% by 2030.

5. How supply will keep with this demand is unknown: the IEA in its World Energy Outlook 2006 stated that “the ability and willingness of major oil and gas producers to step up investment in order to meet global rising demand are particularly uncertain.” The risk of supply failure is growing. The current and urgent challenge confronting the international community is the identification of plausible ways to maintain reasonable energy prices, mitigate the adverse effects of high petroleum prices, minimize fossil fuel supply

² Energy Information Administration / US Department of Energy, International Energy Outlook, June 2006

disruptions, lower the increase in consumption of fossil fuels and minimise climate change effects stemming from greenhouse gas emissions as well as design the energy supply in such a manner that it is environmentally and socially sustainable and allows access to modern energy services for all mankind.

6. Consumption of petroleum products globally has fuelled environmental concerns particularly as they relate to climate change. The smaller island states of the Caribbean are only minor contributors to greenhouse effects through the release of CO₂, but are vulnerable to sea level increase and changes in climate conditions, such as lower precipitation and a higher occurrence and intensity of hurricanes. Several international conventions such as the Kyoto Protocol, attempt to secure commitments to reduce global emissions from energy-related activities. In parallel, there have been important technological advances designed to minimise adverse environmental impacts.

2.2 Regional setting

7. The Caribbean Community consists of developing small island States and low lying coastal States, all of which exhibit unique and peculiar characteristics, including, inter alia, varying topographies, limited natural resources, small populations and fragmented markets with different energy product specifications.

8. CARICOM countries consume approximately 240,000 boepd³ and approximately 95% of this amount is derived from fossil fuels. With the exception of Trinidad and Tobago and to a lesser extent Belize,⁴ CARICOM countries are essentially net importers of crude oil and refined products, largely from extra-regional sources. Specifically, CARICOM Member States source petroleum products from Trinidad and Tobago (PETROTRIN), Curacao (PDVSA), and more recently Puerto Rico (Shell), and St. Croix (Hovensa). Table 1 illustrates CARICOM's Petroleum Demand and Supply Balances as at 2006.

³ boepd = barrels of oil equivalent per day

⁴ Belize recently began exporting crude but still imports refined products.

9. Owing to increasing international demand for petroleum and rising petroleum prices, CARICOM countries are grappling with critical issues relating to security of supplies and pricing and transportation arrangements for petroleum products traded in the region. With a view to ameliorating the deleterious economic effects of high petroleum prices, many CARICOM States have availed themselves of support available from Trinidad and Tobago's Petroleum Stabilization Fund implemented in July 2004, and the Energy Co-operation Agreement (PETROCARIBE) signed in June 2005. As adumbrated in the Energy Co-operation Agreement, the primary purpose of the PETROCARIBE arrangement is to contribute to the social and economic development of Caribbean countries, through the principles of integration outlined in ALBA⁵.

10. In June 2005, eleven (11) CARICOM Member States⁶ signed the Energy Co-operation Agreement (PETROCARIBE), while so far nine (9) CARICOM Member States⁷ have signed bilateral agreements with Venezuela. With respect to the Trinidad and Tobago's Petroleum Stabilization Fund, TT\$750 million (US\$ 125 million) of grant funds have been disbursed as at the end of December 2006.

11. With respect to the refining capacity of the CARICOM region, there are three

⁵ Bolivarian Alternative for the Americas.

⁶ Eleven Members of CARICOM signed the Framework Agreement - Antigua and Barbuda, The Bahamas, Belize, Dominica, Grenada, Guyana, Jamaica, Suriname, Saint Lucia, St. Kitts and Nevis and St. Vincent and the Grenadines

⁷ Nine Members signed bilateral agreements - Antigua and Barbuda, Belize, Dominica, Grenada, Guyana, Jamaica, Suriname, St. Kitts and Nevis and St. Vincent and the Grenadines

refineries with a total capacity of 202,000 bpd⁸. The total expenditure for planned refinery upgrade projects for all 3 refineries has been projected to exceed US\$1.5 billion. In light of the scarce resources available to the Governments of the region for economic development, opportunities exist for integration or rationalization of regional refining industry and production capacities in the energy sector.

12. Currently, a CET⁹ of 10% to 20% is applied on petroleum products imported from extra-regional sources. Products originating from refineries within the CARICOM Single Market (CSM) and imported crude oil are zero rated. At the Seventeenth Inter-Sessional Meeting of the Conference of Heads of Government of the Caribbean Community, the Heads “welcomed the expression of willingness of Trinidad and Tobago to facilitate PETROCARIBE and to support the application for suspension of the Common External Tariff by Member States when made to the COTED¹⁰”

13. In 2006 CARICOM implemented the CSM, with plans for the CARICOM Single Economy (CSE) to come on stream in 2008. With a view to achieving one of the principal CARICOM Single Market and Economy (CSME) objectives of accelerated, co-ordinated and sustained economic development and convergence, it is incumbent upon Member States to secure adequate energy supplies; increase renewable energy sources; ensure environmental protection, and promote measures for solidarity among Member States in times of energy crises.

2.3 Energy Situation in SVG

14. St. Vincent and the Grenadines (SVG) is a multi-island state comprising the main island of St. Vincent and seven smaller inhabited islands with about 30 uninhabited islets and cays constituting the Grenadines. Together, they occupy a total landmass of 388 km². The estimated population of SVG is approximately 110,000 people, with less than 100,000 of those living on the main island St. Vincent.

⁸ bpd = barrels per day

⁹ CET = Common External Tariff

¹⁰ Summary of Recommendation and Conclusions of the Seventeenth Inter-Sessional Meeting of the Conference of Heads of Government of the Caribbean Community, Port of Spain, Trinidad and Tobago, 9-10-February 2006

15. SVG is heavily dependent on imported petroleum products for electricity generation, transportation, cooking, and other energy requirements. SVG has an energy mix with more than 96% petroleum base and about 3% hydro power. All islands except St. Vincent depend entirely on diesel generation for their electricity supply.

16. SVG's state-owned utility VINLEC is the sole provider of electricity to the main island St. Vincent, and the Grenadines islands of Bequia, Union Island, Canouan, and Mayreau. The company operates diesel and small hydro power stations on mainland St. Vincent, while the Bequia, Union Island, Canouan and Mayreau islands are completely reliant on diesel powered systems. The other Grenadines islands are supplied by privately owned electricity systems on the basis of diesel plants.

17. Almost half of the electricity delivered is consumed by the domestic sector, while the commercial sector (includes the public consumption for hospitals, schools, administration buildings etc.) is in a very close second position. Industry and street lighting are of minor importance.

18. SVG has substantial renewable energy sources to provide for heat (solar thermal, biomass) and electricity (wind, geothermal, hydro, and solar) and possibly fuel (biomass). Those resources can cover larger shares of the energy needs as this is presently not taking place. While the use of hydro power for electricity generation has a long-standing tradition, the active tapping of solar energy for hot water production is of recent nature. Both technologies are mature and competitive.

19. According to preliminary studies elaborated with assistance from the German Agency for Technical Cooperation (GTZ) within the Caribbean Renewable Energy Development Programme (CREDP) further potential exists for additional hydro power exploitation through rehabilitation and expansion of existing plants and development of new sites. The conservatively estimated unused hydro power potential is in the range of 5 – 10 MW, namely from the rivers of Wallilabou and Bucament.

20. The use of solar collectors for hot water production is already wide-spread and

mainly common on larger domestic buildings. To date all collectors are imported models, mainly brought in from Barbados. It is obvious that the installation of such appliances could be further extended to ensure that all hot water needs are covered by solar energy. This refers mainly to private households which currently use other means of hot water generation, but also and in particular to all larger consumers of warm water, such as hospitals, hotels and restaurants.

21. There is considerable wind energy potential mainly on the eastern side of St. Vincent and Bequia and on all of the smaller islands. Traditionally, wind power has been utilized in the past for grinding of grains.

22. With assistance from CREDP/GTZ, potential wind sites for small wind parks have been identified. Since September 2005, VINLEC records wind data at a site at Brighton. The measured mean wind speed of the first nine months is above 8 m/s in 10 m height indicating even higher wind speeds in 40 to 50 m, which is the average hub height of a standard wind turbine suitable for St. Vincent. Another wind measurement tower has been put into operation at Ribishi Point close to the landfill site in March 2007, recording wind speeds and directions at 10m and 30m height.

23. Biomass resources are currently mainly exploited in a non-sustainable manner through the use of charcoal. There are no known biogas plants or other applied technologies that make use of biomass resources in a modern way. The potential to extract oil from coconuts or other seeds (like *Jatropha* – also known as Barbados nut in the region) and use this oil either in its pure form or transfer it into biodiesel has so far not been examined.

3 Policies and Goals

3.1 *Planning and Management*

The growing importance being accorded to energy issues necessitates the need to ensure that there is the ability to effectively plan and manage the national energy sector so as to assist in reducing the

uncertainty in decision making for the public and private sector. Through this policy Government will strengthen its capacity to formulate, implement and monitor energy policies and programmes in a coordinated manner.

For this task to be fulfilled effectively it is essential that the database on all relevant aspects of the energy sector is complete and consistent and continuously kept up-to-date. In addition, the implementation of the National Energy Policy and the coordination of individual actions require an appropriately staffed designated authority within the Government and it may be necessary to create and develop new sections and add new staff positions within the public and private sector.

The goal for planning and management in the energy sector is:

Efficient and well-coordinated planning and management activities to achieve sustainable supply and use of energy.

Policies

- 3.1.1 Ensure that energy planning and management addresses the efficient and sustainable use and management of imported and natural energy sources
- 3.1.2 Improve, expand and maintain a database on all energy-relevant aspects
- 3.1.3 Improve decision-making and encourage more effective co-ordination of energy sector planning and management
- 3.1.4 Promote the delivery of efficient and cost-effective energy services
- 3.1.5 Designate an authority with adequate resources within the Government that is responsible for the National Energy Policy and coordinates its implementation with the various Government Departments

- 3.1.6 Create appropriate staff positions within VINLEC and other state-dependent institutions in order to implement the National Energy Policy
- 3.1.7 Provide educational programmes relating to energy sector issues, including in particular conservation, efficiency and use of renewable energy sources
- 3.1.8 Elaborate (and regularly update) an Action and Implementation Plan detailing potential energy sources and technologies, timescales and investments required to service SVG's growing energy demand in a sustainable manner
- 3.1.9 Ensure that international funding and technical assistance is made available and the energy policy is developed within the context of regional approaches and objectives.

3.2 Power Sector

Reliable and affordable electricity is essential for the economic and social development of Saint Vincent and the Grenadines. Key issues include increasingly high costs for imported fuel and the option to use cost-efficient natural resources, such as hydro, wind, solar and geothermal energy. Further problems arise from the country-wide inexperience of using such resources, the partially inefficient generation of electricity with older diesel and hydropower schemes and the inefficient consumption of electricity.

The goal for the power sector is:

Safe, efficient, reliable, affordable and environmentally friendly electricity generation and supply for all parts of St. Vincent and the Grenadines.

Policies

- 3.2.1 Improve the efficiency of power production, transmission and distribution to optimise costs and fuel consumption

- 3.2.2 Promote sound energy efficiency and conservation practices for all consumers
- 3.2.3 Explore the existing potentials of renewable energy sources for electricity generation
- 3.2.4 Support the introduction of new commercially proven generation technologies that are environmentally, economically, financially and socially viable
- 3.2.5 Access imported fossil fuels at lowest costs, respecting environmental concerns and supply security
- 3.2.6 Establish mechanisms that allow for a fair access to the transmission/distribution grid and provide the basis for a stronger involvement of the private sector in electricity generation.

3.3 Renewable Energy

Indigenous Renewable Energy Sources (RES) in the form of solar, wind, hydro and geothermal provide the most appropriate long-term alternative sources to replace imported petroleum products for electricity generation and heat production in SVG. Key issues in renewable energy include a lack of technical expertise and relatively weak institutional structures that would allow public or private investors to tap such resources in a timely manner and secure environment. The current situation is further defined by insufficient knowledge about the RES potentials, lack of financial commitment and support to renewable energies as well as insufficient private sector participation and investment.

The goal for renewable energy is:

Increase the utilisation of renewable energy technologies on all islands of Saint Vincent and the Grenadines.

Policies

- 3.3.1 Promote the increased use of appropriate renewable energy technologies, which are technically and commercially proven, financially and economically viable, and environmentally friendly.
- 3.3.2 Analyze the potentials of renewable energy sources on all islands, make site-specific assessments and elaborate project proposals.
- 3.3.3 Develop local expertise in the production, installation, operation, management and maintenance of technically and economically proven renewable energy systems.
- 3.3.4 Encourage private sector participation in the development, financing and management of renewable energy projects.
- 3.3.5 Design and initiate a national Renewable Energy education and awareness for all sectors of the civil society.
- 3.3.6 Provide financial and fiscal incentives that allow Renewable Energy technologies to be market competitive, taking into account economical benefits from the use of such technologies.
- 3.3.7 Investigate options and potential benefits from importing biofuels to Saint Vincent and the Grenadines.
- 3.3.8 Consider the mandatory installation of solar thermal collectors for all major users of hot water.

3.4 *Petroleum Sector*

Importation of petroleum products, including LPG, accounts for a significant and steeply increasing proportion of total national imports of SVG. Moreover, they are fundamental to SVG's socio-economic development and will continue to be so for the foreseeable future. The maintenance of a reliable and cost-effective supply of petroleum products is essential.

The cost of fuel imports per unit should be minimized through good supply contract negotiations and management. The overall volume of petroleum derivate imports should increase at a lower rate than economic growth through appropriate conservation and efficiency measures and by substituting the use of petroleum with renewable energies.

A clean environment is crucial to the economic and social well-being of the people of SVG. Irresponsible use and handling of petroleum products can cause significant damage, particularly in fragile island coastal and marine environments. For this reason, the proper importation, handling, storage and use of petroleum products and management of waste petroleum derivates (mainly lubricants) is an important issue.

The goal for the petroleum sector is:

Safe, reliable and affordable supplies of petroleum products and its efficient and clean handling and use.

Policies

- 3.4.1 Ensure a secure and reliable supply of petroleum products at lowest import costs available, and conforming to agreed product standards and specifications
- 3.4.2 Encourage fuel conservation and efficient end-use, thereby reducing dependence on imported petroleum products.
- 3.4.3 Ensure that new and existing petroleum storage and handling facilities conform with standards approved for SVG.
- 3.4.4 Ensure that adequate storage facilities for petroleum products are available throughout SVG at strategic locations.

3.4.5 Promote the collection, transportation, environmentally responsible re-use, disposal, or removal of waste oil and other petroleum by-products to minimize adverse impacts on soil, ground-water, and near-shore fisheries.

3.5 Transportation

Road, air and marine transport provide an essential service that enables economic and social development. The transportation sector in SVG consumes a large proportion of the imported petroleum products in the form of gasoline, diesel and aviation kerosene. Clearly the introduction of measures that conserve transports fuels and increase the efficiency of their use will have long-term economic and environmental benefits for SVG.

The goal for transportation is:

Efficient, environmentally clean and cost-effective transportation.

Policies

- 3.5.1 Improve fuel conservation and efficiency for the land and marine transport sectors
- 3.5.2 Minimise the detrimental impact of petroleum product consumption in the transport sector on land, atmosphere and marine environment.
- 3.5.3 Provide the basis and sufficient incentives for improvements of the public transport system as alternative to individual vehicle use.
- 3.5.4 Improve road conditions and traffic management as to avoid congestions and prioritize public transport busses.
- 3.5.5 Investigate consequences and benefits of substituting the use of gasoline by LPG for taxis.

- 3.5.6 Take adequate measures to minimize the import of outdated and high-consuming second-hand cars
- 3.5.7 Introduce a taxation system that gives incentives for the use of fuel-efficient passenger cars and other vehicles
- 3.5.8 Introduce regular motor check-ups to avoid unnecessary emissions and limit the fuel consumption to the lowest possible level.

3.6 Energy Efficiency

Energy efficiency is a cross-cutting issue that touches the generation and consumption of electricity as well as the use of fuel in the transport sector. From society's perspective, achieving greater energy efficiency generally requires less investment than does new generation, and also means less energy-related environmental impact. From an individual's perspective, it can mean significant savings over the long term. However, despite the obvious benefits, there has historically been a lack of energy-efficiency initiatives in SVG.

The goal for energy efficiency is:

Minimized energy input and lowest possible energy intensity for all energy-related services

Policies

- 3.6.1 Promote energy audits for key energy consuming sectors, such as industries, hotels, restaurants and public buildings
- 3.6.2 Provide fiscal incentives for the import of energy-efficient appliances
- 3.6.3 Strengthen consumer information on purchase and use of energy-efficient appliances

- 3.6.4 Carry out studies on consumption patterns in different sectors to be used in the design of appropriate energy-efficiency measures
- 3.6.5 Raise the general awareness about energy efficiency among the civil society, e.g. by organizing regular energy weeks
- 3.6.6 Establish standards for the insulation of new buildings that will be equipped with air-conditioning systems
- 3.6.7 Consider further fiscal measures in respect of incandescent light bulbs.
- 3.6.8 Continue the grant of fiscal incentives for the use of energy-saving light bulbs.

I. Introduction

The following policies outlined in the National Energy Policy (NEP) approved by Cabinet in February, 2009 have been considered during the preparation of the Energy Action Plan (EAP) for Saint Vincent and the Grenadines.

- a) **Planning and Management:** Achieve sustainable supply and use of energy
- b) **Power Sector:** Improve efficiency of production and Transmission & Distribution (T&D), promote energy efficiency practices among consumers, support introduction of green technologies, explore potentials of Renewable Energy Sources (RES), access fossil fuels needed at lowest available costs, stronger involvement of the private sector
- c) **Renewable Energy:** Increase the utilization of Renewable Energy Technologies (RET), develop local expertise, encourage private sector participation, initiate Renewable Energy (RE) education and awareness, provide fiscal and financial incentives for RET, explore benefits and potential of biofuels, mandatory installation of Solar Water Heaters (SWH)
- d) **Petroleum Sector:** Secure reliable and affordable supply of petroleum products, fuel conservation and efficient use, high standards for handling petroleum products, ensure adequate storage facilities, environmentally responsible disposal of waste and petroleum products
- e) **Transportation:** Improve fuel conservation for land and maritime sectors, minimize detrimental impact of petroleum products consumption, increase ridership of public transportation, improve road conditions and traffic management, substitute gasoline with LPG fleets, minimize importing of second hand cars, apply incentives to import and use more efficient vehicles, regular motor checks to reduce emissions
- f) **Energy Efficiency:** Promote energy audits for major energy consumers, provide fiscal incentives for Energy Efficient Technologies (EET), strengthen customer information on energy efficiency (EE) appliances, carry-out studies of consumption patterns to design appropriate EE measures, general awareness of EE in civil society, standard regulations for buildings, ban incandescent light bulbs

II. Current Situation

2.1 Fuel imports and energy costs

Saint Vincent and the Grenadines (SVG) has a population of 100,272 (2006 estimate)¹ of which approximately 92% lives in Saint Vincent. Other islands of importance are Bequia, Union Island and Canouan. Because of its small size and a lack of large industrial activities, SVG has a low demand for energy.

The country is currently almost completely dependent on imported petroleum products like gasoline (for transport), diesel (transport and electricity generation), kerosene (cooking) and butane/LPG (cooking, water heating, and industry). Only Saint Vincent has installed capacity for electricity generation from hydro. Figure 1 presents the increase of fossil fuel imports in the last 7 years.

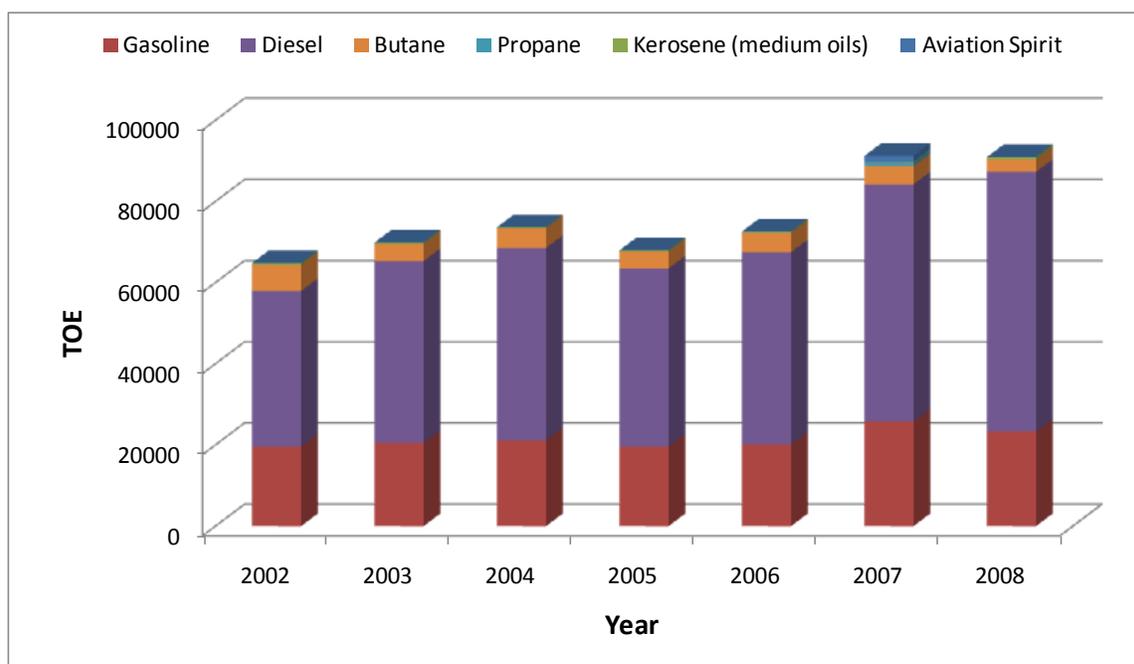

Figure 1. Oil derivatives imports in tonnes of oil equivalent for 2002-2008 (Source: Statistics Office, 2009)

2.1.1 Total energy consumption

The total energy consumption (only fossil fuels) went from 64,840 Tonnes of Oil Equivalent (TOE) in 2002 up to ~91,000 TOE² in 2008. Meanwhile, hydro power contributed slightly less than 2,000 TOE in 2008, i.e. the share of renewable energy (not counting non-commercial biomass, charcoal and solar thermal energy) was about 2% of

¹ Statistical Office of Saint Vincent and the Grenadines

² There is a slight discrepancy between data provided by Customs and by the Statistics Department; values from Statistics Office were the ones considered, underlining the need for consistent energy statistics to be developed.

total energy consumption. In Saint Vincent alone, renewable energy in the form of hydro power contributed an estimated 5% to the total primary energy consumption. Diesel and gasoline alone add-up >90% of the energy matrix of SVG, see Figure 2 and Table 1.

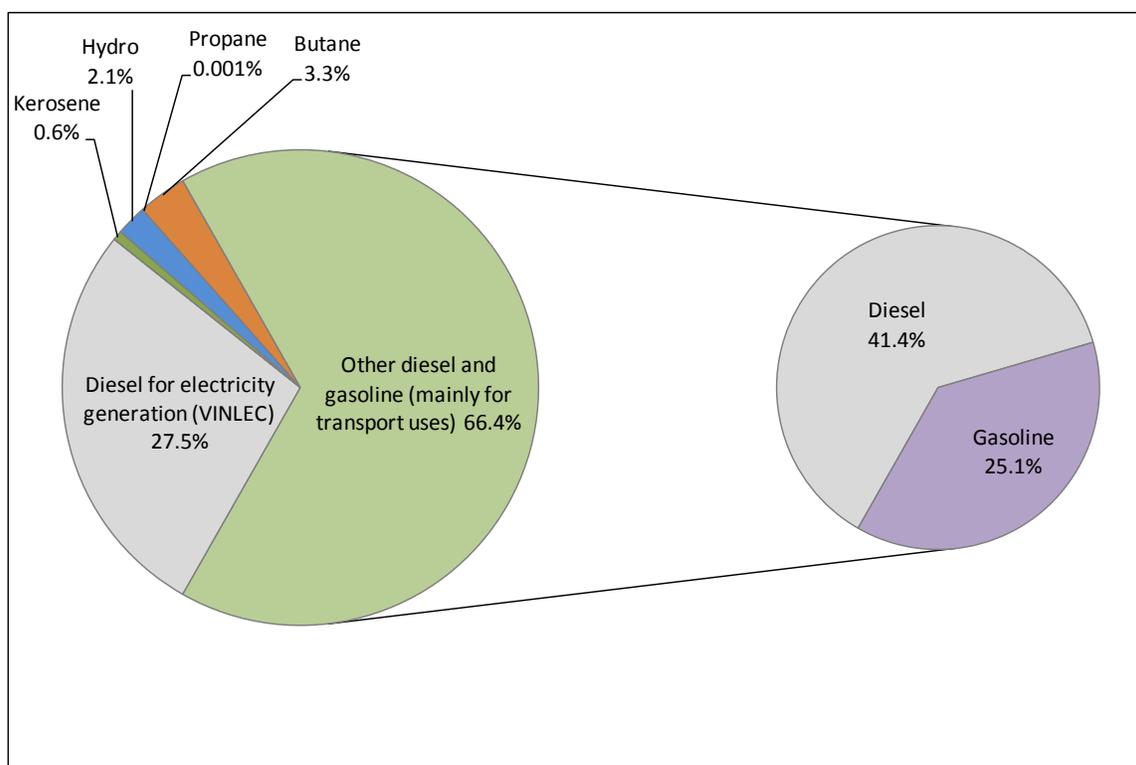

Figure 2. Energy matrix of Saint Vincent and the Grenadines by energy source in 2008 (Sources: Statistics Office and VINLEC, 2009)

Fuel	TOE
Diesel (VINLEC)	25,549
Aviation Spirit	5
Kerosene	598
Hydro	1,953 ³
Propane	0.78
Butane	3,074
Diesel (transport et al)	38,430
Gasoline (transport et al)	23,299
TOTAL	92,909

Table 1. Energy matrix values in TOE (Source: Statistics Office, 2009)

2.1.2 Fossil fuel imports trends

Spending on imports of fossil fuels has increased considerably due to the rising price for oil products on the world markets. The price of oil has increased from about US\$ 32 per

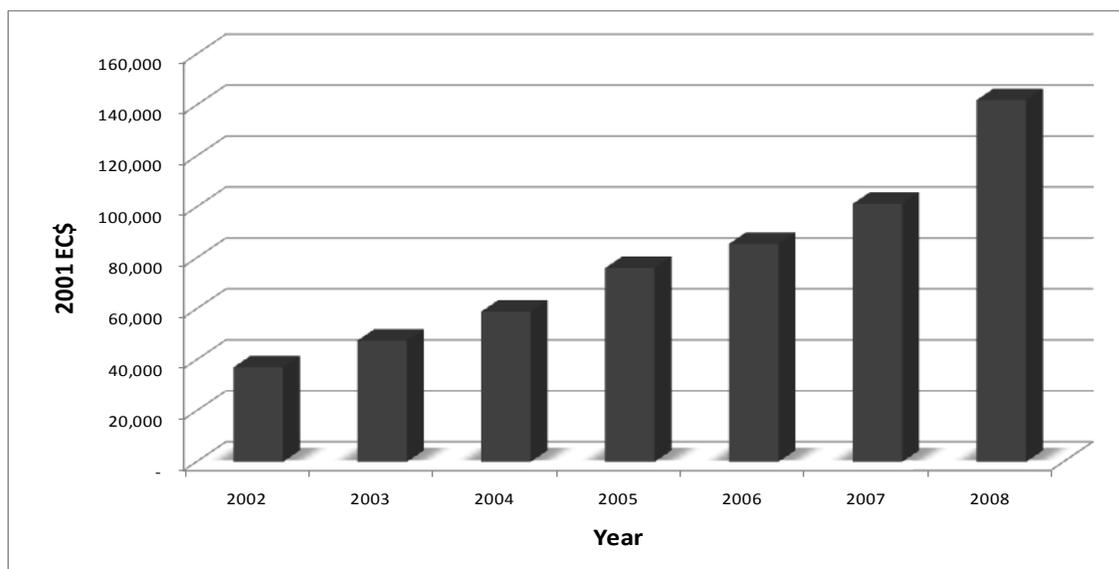

³ Gross electricity production from hydro plants is used as the primary energy form, as suggested by the IEA Energy Manual of Statistics, 2005, pg.137.

barrel at the beginning of 2004 to more than US\$ 70 in April 2006 with a new record-high of US\$ 147 in July 2008 (see Figure 3). Prices collapsed in 2009 down to less than US\$40 per barrel and in 2010 have soured back to levels above US\$70.

Figure 3. [New York Mercantile Exchange](#) prices for West Texas Intermediate 1996 - 2009

Considerable increase in expenditure for petroleum derivatives imports have taken place in the period of 2003-2008 (see Figure 4), where almost 17% of the country's GDP was destined to fossil fuels imports in 2008, see Figure 5. There is the general belief that petroleum prices tend to remain above previous levels due to increased shortages on the world market and oil findings (reserves) reaching a peak by the end of this decade⁴.

⁴ Reserves to production ratio. Some studies suggest that this point has already been passed, see e.g. Energy Watch Group, Oil Peak, "Crude Oil – The Supply Outlook", revised edition February 2009 (www.energywatchgroup.org)

Figure 4. Fossil fuels imports expenditure in 2001 EC\$ (Source: Statistics Office and Eastern Caribbean Central Bank (ECCB), 2009)

Imports for diesel and gasoline will reach about EC\$ 110 million in 2009, as compared to EC\$ 158 million in 2008.

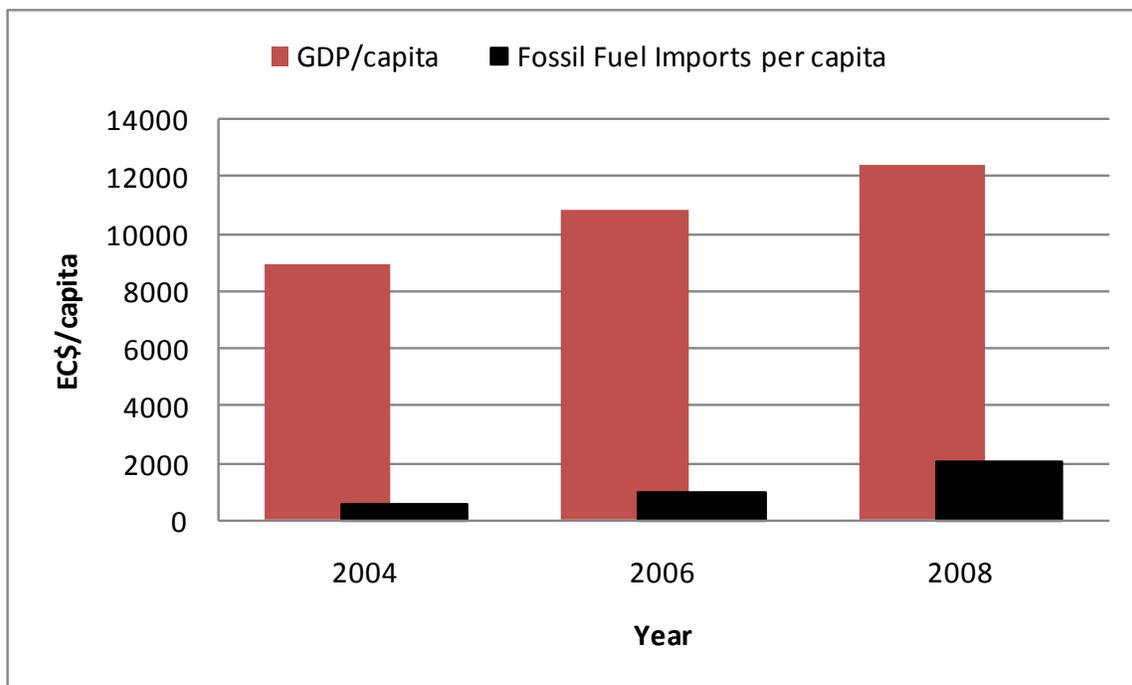

Figure 5. Comparison of GDP per capita vs. fossil fuel expenditure per capita (Sources: Customs and Statistics Office, 2009)

2.1.3 Prices for transport fuel

Energy prices in SVG are high compared to international standards⁵ (not counting high fuel taxes imposed on energy consumption in other countries), with final consumer or retail costs for transport fuel (at petrol stations) standing at EC\$ 7.25 per imperial gallon for diesel and EC\$ 8.00 per imperial gallon for gasoline in March 2005, and EC\$ 9.50 per imperial gallon for diesel and EC\$ 11.50/imperial gallon for gasoline in the second half of 2006⁶. In July 2008, gasoline was sold for EC\$ 15.33/imperial gallon and diesel at EC\$ 15.50/imperial gallon at the petrol station, doubling the price of just three years earlier. In August 2009 the price was EC\$ 10.61 per imperial gallon for gasoline, showing an upwards trend (see Figure 6).

⁵ Nonetheless, they are still comparable to other island states in the region.

⁶ New pricing schemes came into effect on January 25, 2006. Slightly discounted prices apply to the wholesale market.

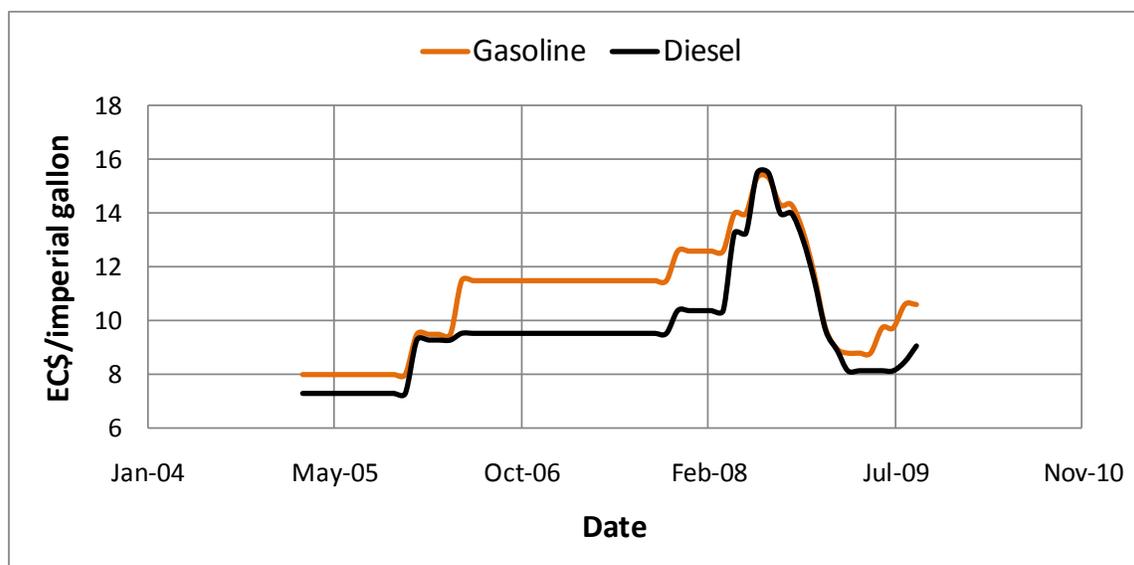

Figure 6. Transport fuels pump prices (Source: Ministry of Trade)

2.1.4 Prices for cooking and other purposes

The price for LPG used in approximately 20,000 households mainly for cooking purposes was also increased in early 2006. In September 2009 the cost of a 20 lb cylinder was EC\$ 35-40⁷, and a 100 lb cylinder EC\$ 163-184.^{8,9} However, with the implementation of the Energy Cooperation Agreement (PetroCaribe) signed by the Government in 2005, these price increases were effectively curtailed through the introduction of cheaper LPG supplies under the Agreement, a 22 lb cylinder costing EC\$29.00 and a 100 lb cylinder EC\$155.00. Further, kerosene fuel increased up to EC\$15.10/imperial gallon in July 2008 and went down to EC\$ 8.77/imperial gallon in September 2009.

2.1.5 Fuel price regulation

All fuel prices to end-consumers have a three-month delay¹⁰ and therefore do not reflect current variations of prices in the import market. Between January 2005 and January 2006 prices were kept constant (under government control regulations) despite significant cost increases for the purchase of fuels, leading to government subsidies of EC\$ 6 million in total.

2.1.6 Electricity rates and generation costs

Electricity tariffs are composed of a unit cost per kWh, a minimum base charge for

⁷ Prices for LPG vary per Area, where Area I (Kingstown and suburbs) and Area II (windward up to Langley Park and leeward coast up to Wallilabou) is EC\$ 35 per 20 lb cylinder; Area III (windward coast up to Fancy and leeward coast up to Richmond) is EC\$ 36 per 20 lb cylinder; and Area IV (Grenadines) is EC\$ 40 per 20 lb cylinder.

⁸ Price controls by the government for LPG were established in 2005 as consequence of conflicts with the only supplier, Texaco.

⁹ St. Vincent and the Grenadines Statutory Rules and Orders, 2006 No. 7. Gazetted 31st of March, 2006.

¹⁰ Monthly adjustment of prices on the basis of previous three-month average.

domestic and commercial consumers, a demand charge for commercial and industrial customers, and a fuel surcharge per kWh, which varies monthly depending on fuel costs (in April 2006, the fuel surcharge was EC\$ 0.372/kWh), see Table 2 for further details. In addition, a 15% Value-Added Tax (VAT) is levied on kWh consumption of over 200 units for domestic consumers¹¹, and on the total consumption for commercial and industrial consumers.

Type of Customer	< 50 kWh/month	>50 kWh/month	All units	Minimum Charge	Demand Charge
Domestic (EC\$)	0.425	0.50		5	
Commercial (EC\$)			0.48	15	12
Industrial (EC\$)			0.44		12
Street Lighting (EC\$)			0.565		

Table 2. Electricity rates in Saint Vincent and the Grenadines effective since December 1989¹²

As a consequence of oil price hikes, electricity tariffs increased considerably in recent years (see Figure 7). In 2007 households paid on average EC\$0.89/kWh including fuel surcharge, in 2008 this increased to nearly EC\$ 1.05/kWh, i.e. the average annual household bill for electricity increased to about EC\$ 1,700. Due to lower fuel prices, average consumer costs for electricity have dropped to EC\$ 0.85/kWh in mid 2009. For every US\$ 10 per barrel of petroleum, the fuel surcharge varies by about US\$ 0.02/kWh.

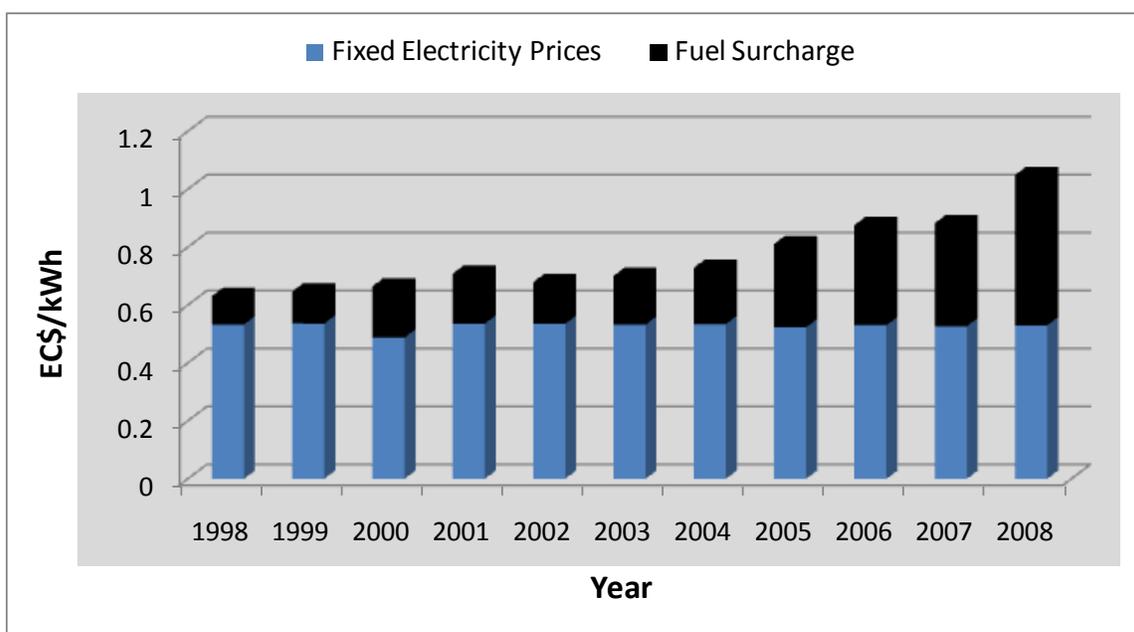

Figure 7. Average cost of electricity for all consumers in accordance to generated revenue from fixed tariffs¹³ and fuel surcharge (Source: VINLEC, 2009)

¹¹ Monthly average electricity consumption in the domestic sector was ~150 kWh/month in 2008.

¹² Further details available at: <http://www.vinlec.com/Article3.asp?articleid=15&zoneid=10>

¹³ Includes average cost of kWh to different types of customers, minimum and demand charge, see Table 1.

The increase in the electricity tariff is clearly due to the fuel surcharge, which augmented from a yearly average of EC\$0.09/kWh in 1998, to EC\$0.52/kWh in 2008, an increase of more than 570% in 10 years. Figure 8 shows how the fuel surcharge is on its way to reach the tariffs average operating revenue. In 1998, the fuel surcharge was 15% of the full tariff paid by consumers. In 2008 it was 50%.

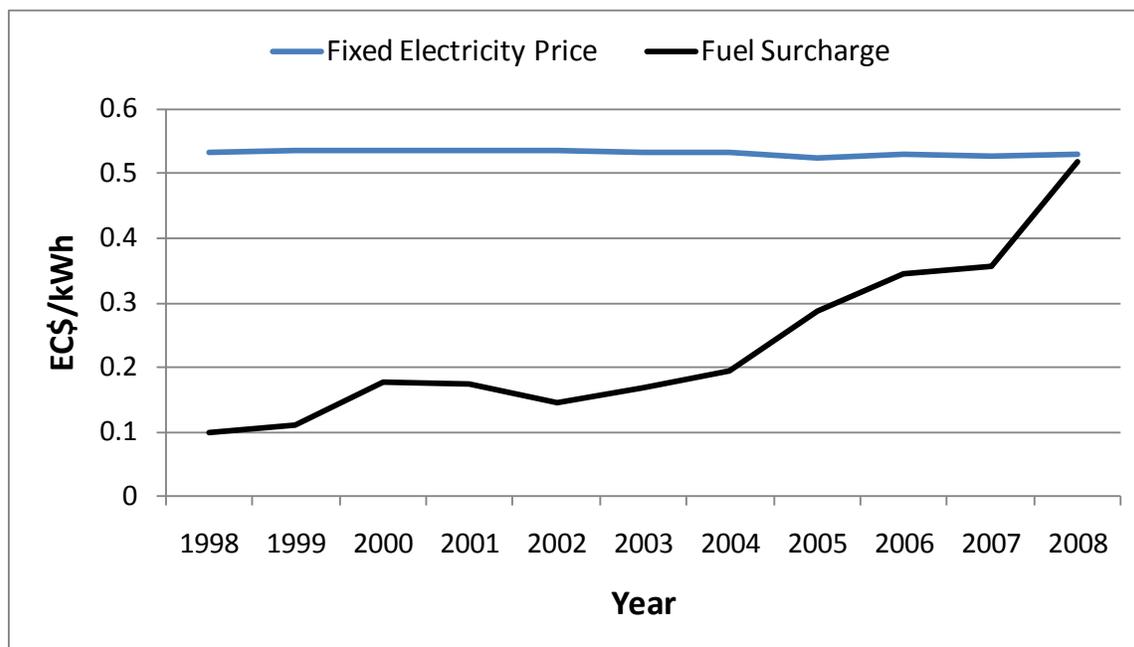

Figure 8. Fuel Surcharge History and fixed electricity prices (represented by the average operating revenue from all types of consumers; inclusive of tariff, demand and minimum charges detailed in Table 2) (Source: VINLEC, 2008)

VINLEC's revenue per unit sold is in line with other small island states in the Eastern Caribbean, like Grenada, St. Lucia and Dominica, which all face extremely high electricity prices due to high priced oil imports and inefficient generation and (in some cases) distribution systems. It is clear that those energy prices negatively affect economic activities, mainly those closely related to energy-intensive consumption, such as food processing, gastronomy and tourism sectors. In this environment, most energy intensive industries will not be competitive against lower priced countries in the region (in particular Trinidad), thus creating a significant obstacle for development in SVG's manufacturing sector. VINLEC has therefore undertaken a Cost-of-Services study that was concluded in 2007. The study looked into its cost structure and came up with recommendations for a tariff revision that minimises cross-subsidies. The study also examined the demand charge levied on both industrial and commercial customers, as well as a review of the base year used to compute the fuel surcharge.

While many of the inputs associated with electricity costs have remained stable, the fuel costs have tended upwards, resulting in an overall increase in electricity generation costs over the past years (Figure 9).

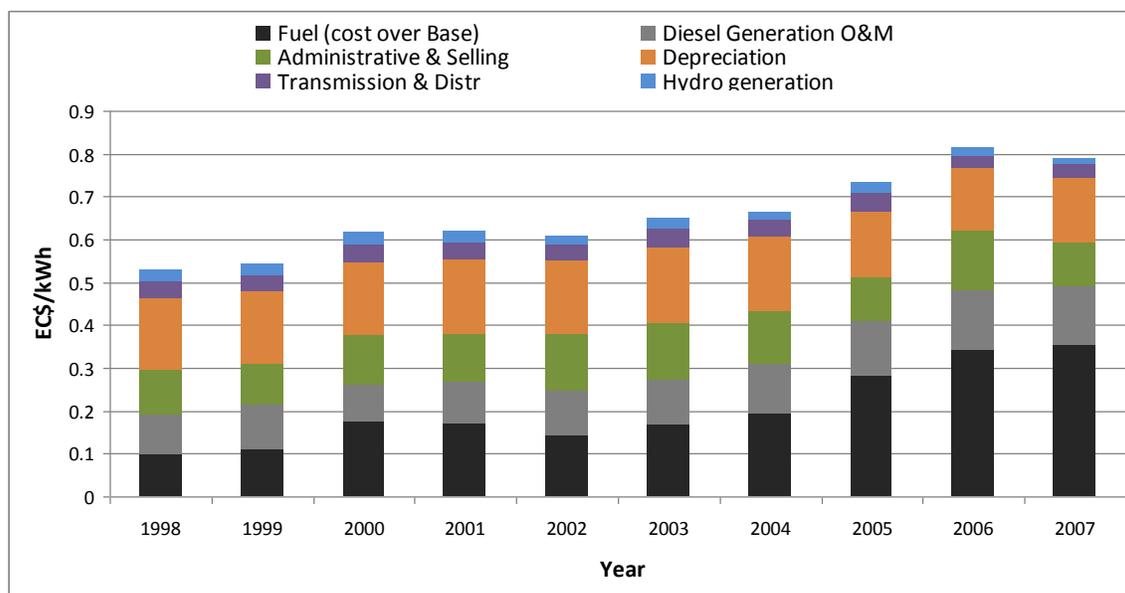

Figure 9. Cost of electricity generation by type of expenditure 1998-2007 (Source: VINLEC, 2008)

It is clear that the increase in generation costs is mainly due to the increase in fuel and also a slight increase in diesel generators' operation and maintenance. Specific fuel costs have increased from less than EC\$ 0.10/kWh in 1998 to EC\$ 0.35/kWh in 2007.

2.2 Electricity sectors

2.2.1 Installed capacity

In 2009, SVG's state-owned utility VINLEC had almost 49 MW installed capacity (11.5% is hydro), of which 40.5 MW are operated on the main island of Saint Vincent alone with two diesel generating facilities, Cane Hall (26.2 MW) and recently commissioned Lowman's Bay (8.7 MW), and three hydro power stations (Cumberland 3.7 MW, Richmond 1.1 MW, and South Rivers 0.9 MW), with the remaining diesel fuelled units distributed among Bequia (2.9 MW), Union Island (1.3 MW), Canouan (3.1 MW) and Mayreau (180 kW); see Figure 10.

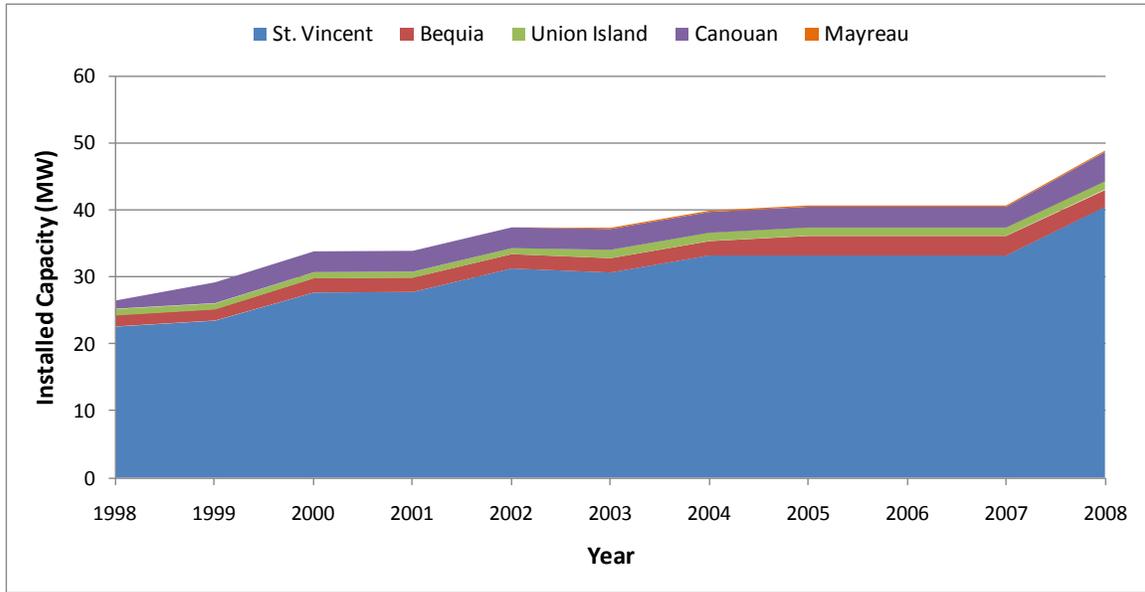

Figure 10. Installed capacity (MW) by location site

The other Grenadines islands are supplied by privately owned electricity systems on the basis of diesel plants. Bequia, Union Island, Canouan and Mayreau are also completely reliant on diesel power. According to VINLEC’s 2007 report, Saint Vincent has some 5.6 MW (constant in the last 10 years) of available hydro power, depicted in Figure 11, and diesel power plants (evolved from 20.8 MW in 1998 up to 35 MW in 2007, an almost 70% increase in diesel power plants capacity).

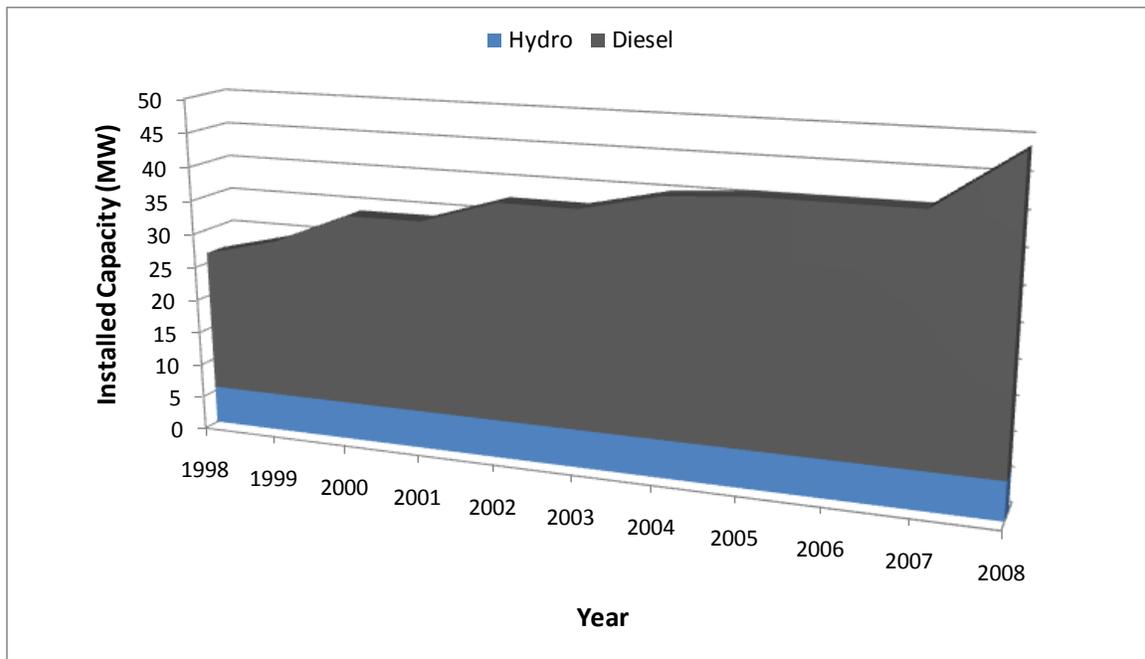

Figure 11. VINLEC’s historical trend of installed capacity (MW)

Further, the hydro (renewable) energy share in 1998 represented more than 20% of the installed capacity, while in 2007 it dropped to less than 14%, as shown in Figure 12.

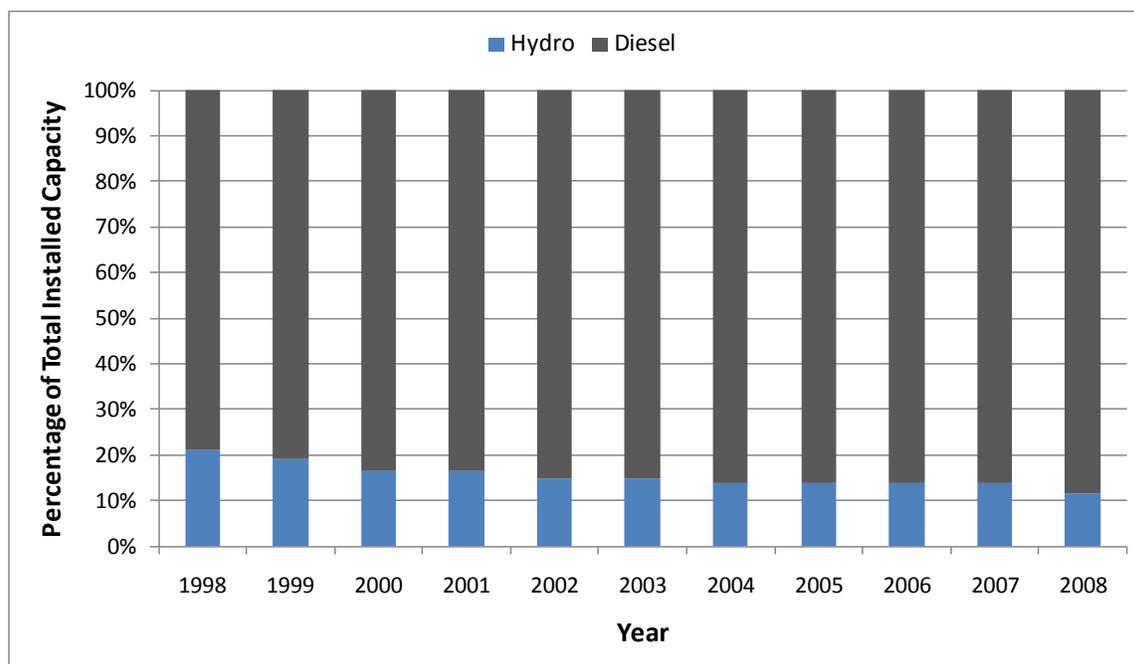

Figure 12. Percentages of installed capacity of diesel and hydro

Since hydro power is not available at full scale year-round and some diesel plants work only as back-up systems, the firm capacity is far lower, and reached only approximately 40 MW in 2009. For Saint Vincent alone, the firm capacity was 32 MW, while peak demand was 20 MW in 2008, thus leaving sufficient reserve margin during most of the year.

Most of VINLEC's diesel generators are old, inefficient, and in need of replacement by newer engines or other means of electricity generation. This represents an opportunity to move towards new sources of energy. The specific energy output of 17 kilowatt-hours per imperial gallon in 2004 from all diesel-powered generators was below comparable data in neighbouring countries. It has increased to slightly over 18 kilowatt-hours per imperial gallon in 2009 with the inauguration of the new generator set at Lowmans Bay.¹⁴

A new diesel plant of 9 MW at Lowmans Bay began operation at the end of 2006. In place of this more efficient plant, outdated generator sets totalling about 6 MW will be decommissioned. The new plant is supplied with diesel under the PetroCaribe Agreement. The Government is also looking to future electricity generation needs and actively pursuing plans for the introduction of an additional 8-10 MW at Lowmans Bay. Works have already started for deployment of two new generators that will operate on Heavy Fuel Oil (HFO), and transformation of the existing diesel-operating units to HFO. New generating units were also installed at the Canouan and Bequia plants in 2007.

2.2.2 Diesel fuel for electricity generation

VINLEC's diesel bill increased considerably since 2004, peaked in 2008, and was lower

¹⁴It is more than 19 kWh in St. Lucia

in 2009 (see Figure 13).

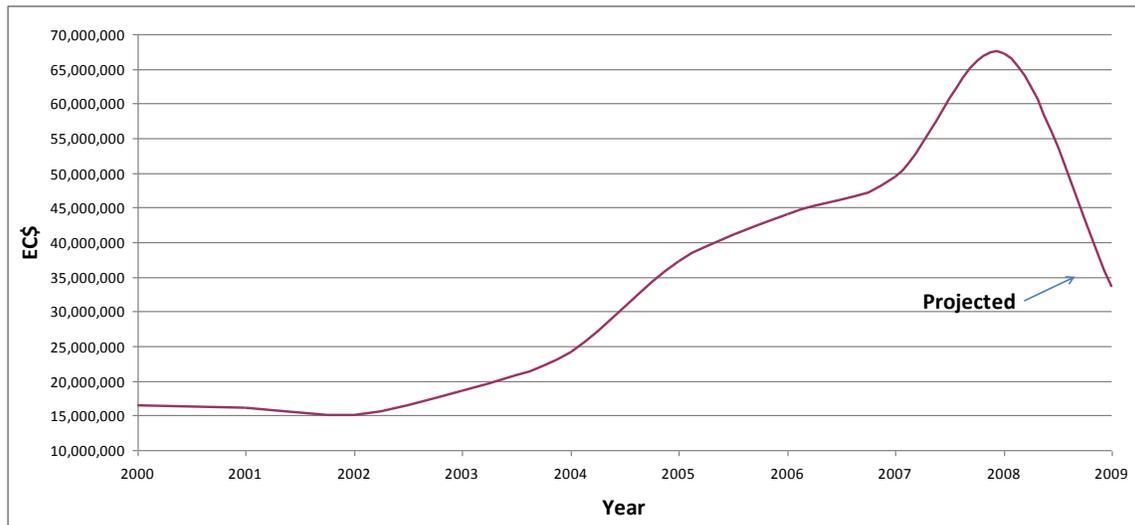

Figure 13. Annual fuel cost for generation of electricity (Source: VINLEC)

VINLEC is the largest sole consumer of imported petroleum products, using ~40% of total diesel imports in 2008 to generate electricity. These numbers give an idea of the potential savings if current fossil fuels were replaced with renewable energy sources. Current CO₂ emissions from the electricity sector are in the range of 77,400 tons per year.¹⁵

2.2.3 Electricity generation and sales

SVG's residential and commercial sectors, including the government, are the largest consumers of electricity (see Figure 14 and Figure 15). On the other hand, there are few industrial activities on the island, and consumption for street lighting is minimal. Total consumption went from 74.6 GWh in 1998, to 122.9 GWh in 2008—a 70% increase in 10 years.

¹⁵The combustion of 1 litre of diesel leads to the emission of about 2.7 kg of CO₂.

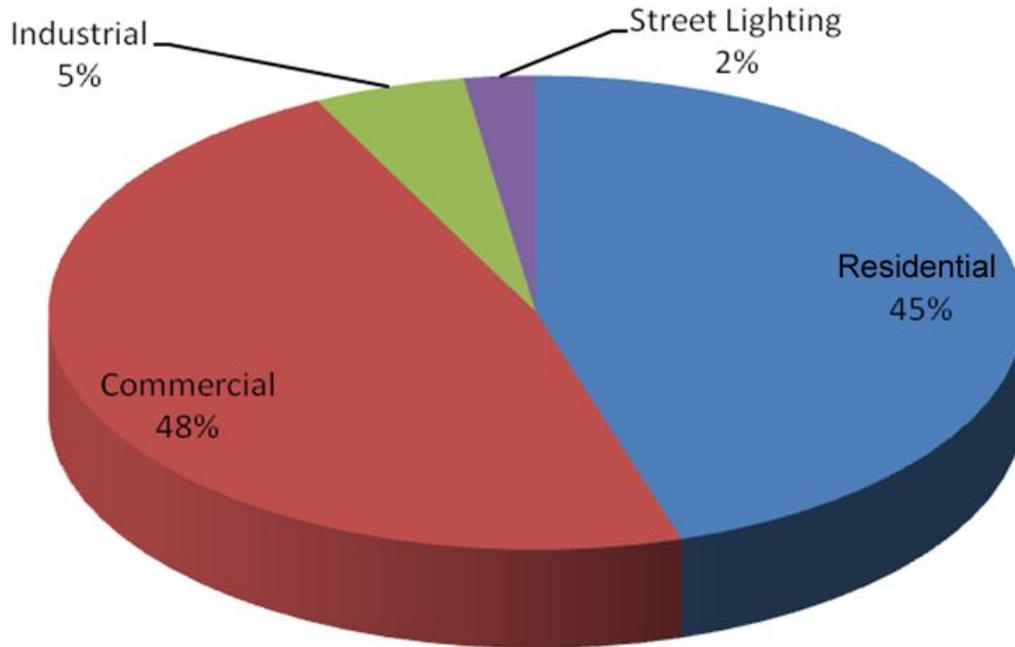

Figure 14. Electricity consumption in Saint Vincent and the Grenadines by sector in 2008 (Source: VINLEC, 2009)

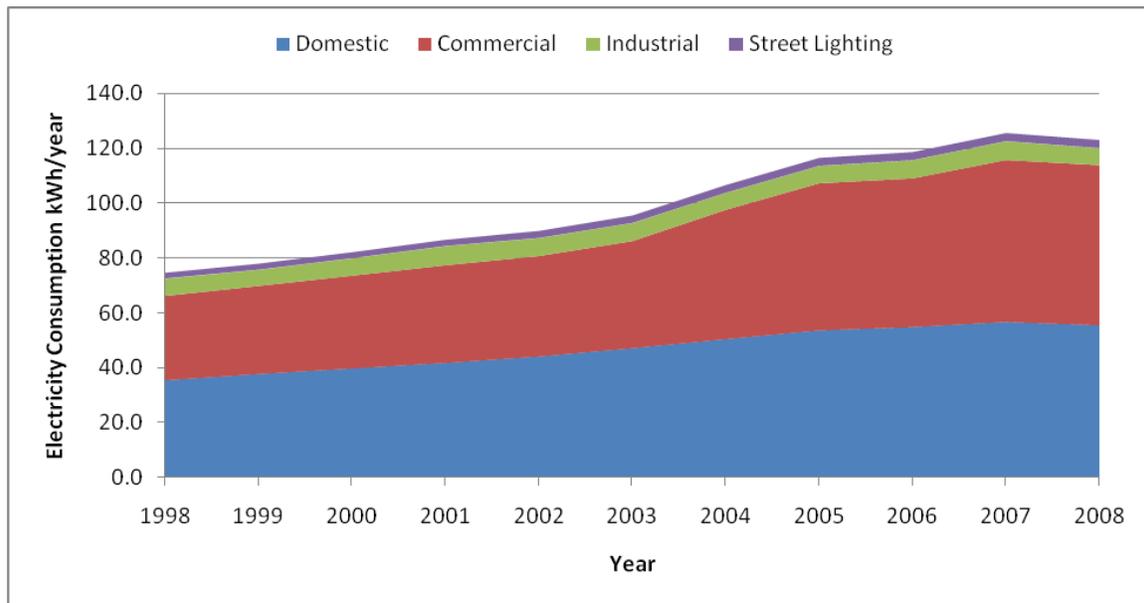

Figure 15. Evolution of energy consumption in Saint Vincent and the Grenadines per sector from 1998-2008 (Source: VINLEC, 2009)

2.2.4 Losses

In 2007, line losses and unmeasured consumption accounted for 8.7% of the total consumption, showing a downward trend since 1998 (see Figure 16). This percentage is considered low when compared to international standards. Nevertheless, a 1% drop in

electricity losses would increase delivered generation by 1.2 GWh.

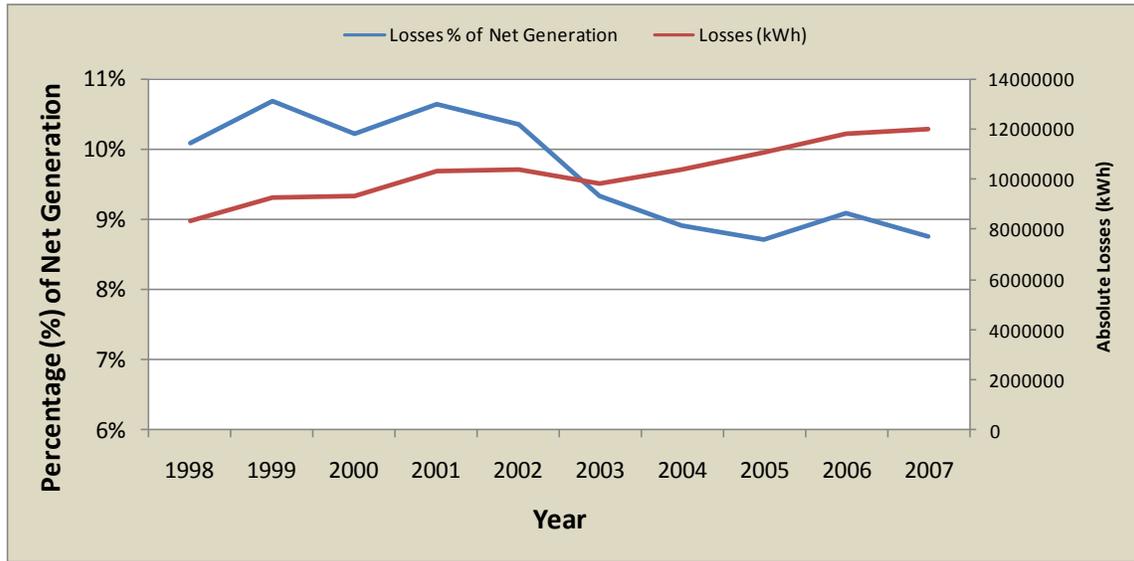

Figure 16. VINLEC technical and non-technical losses % of net generation and absolute losses values (kWh) from 1998-2007

2.2.5 Electricity peak demand

Peak demand in Saint Vincent alone has risen from less than 14 MW in 1998, to 20 MW in 2008 – a 40% increase in 10 years. Peak demand in the Grenadine islands (with the exception of Mayreau) has shown similar increases. Canouan’s peak demand has increased by about 60% (see Figure 17).

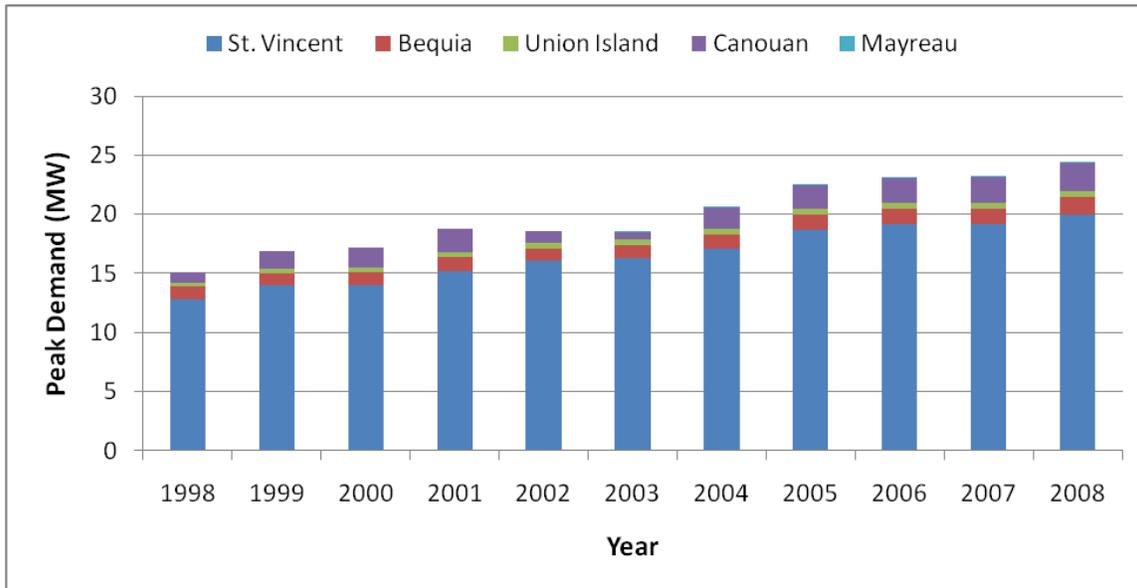

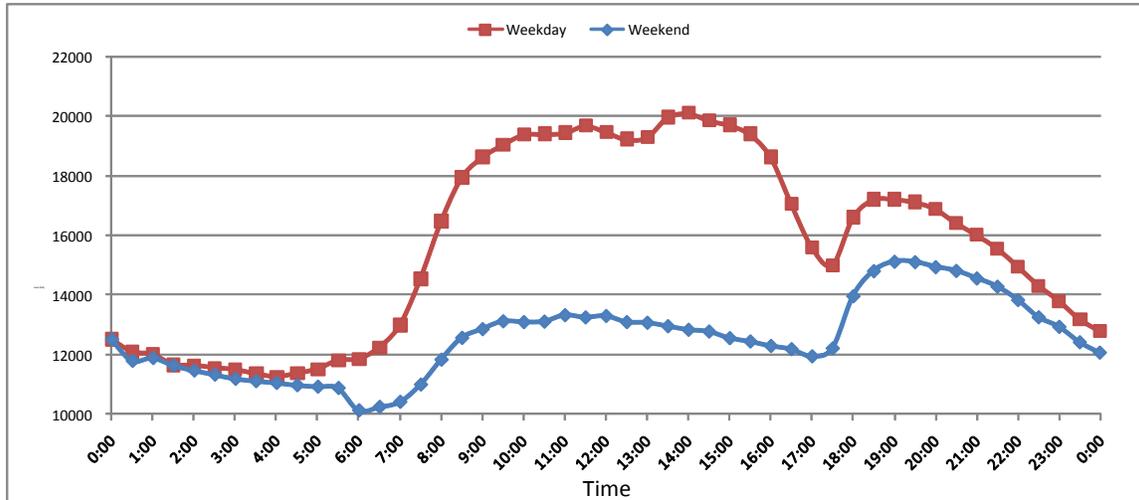

Figure 17. Electricity peak demand evolution (1998-2008) in Saint Vincent and the Grenadines (Source: VINLEC, 2009)

Typical day load curves for Saint Vincent show that peak demand occurs from 10:00 am to 4:00 pm. A smaller peak occurs from 7:00 pm to 8:00 pm on weekdays, whilst weekend peak demand takes place from 6:00 pm to 10:00 pm (see Figure 18). These patterns reveal the hours where efficiency measures are mostly needed.

While energy demand from all sectors increased due to economic growth and rising incomes, the transportation sector fuels the fastest-growing demand. With more than 25,382 vehicles¹⁶ registered in SVG in July 2009 (see Figure 19 for number of imported vehicles per year), private and public transport is the largest energy consuming sector, with 9.7 million imperial gallons of diesel and 6.4 million imperial gallons of gasoline spent in 2008¹⁷, a steady increase is portrayed mainly for diesel in Figure 20. Most of the vehicles are privately owned sedans, but there is also a significant quantity of mini-vans operated by privately owned public transport business.

As of 15th December 2009, there were approximately 1095 vessels operating in the waters of Saint Vincent and the Grenadines. Of these: 50 inclusive of nine (9) local Roro passenger ships, 12 cargo ships¹⁸ are registered with the Maritime Administration; 745 are fishing vessels, of which 738 are propelled by gasoline outboard engines and seven (7) are propelled by diesel engines; there is an estimated 200 private vessels of which 15 have diesel engines; and, there is an estimated 100 small commercial yachts.

¹⁶ Data provided by the Motor Vehicle Registration Statistics, Inland Revenue Department. This may not represent the real size of SVG’s fleet, since many of the registered vehicles may not be actually “on the road”, but should be used as an estimate of the fleet size.

¹⁷ These values represent all diesel and gasoline that was not used for electricity generation. Road and sea transport and other minor fuel consuming activities are taken into account.

¹⁸ These cargo ships trade within the Caribbean area. They may fuel outside of St. Vincent and the Grenadines

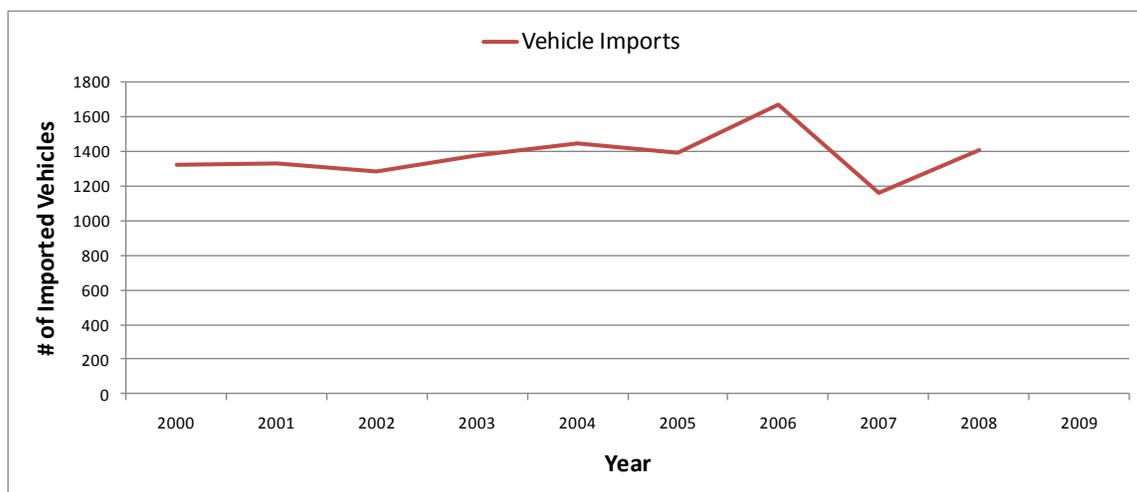

Figure 19. Motor vehicle registration values from 2000-2009 and number of imported vehicles per year (Source: Licensing Office, Inland Revenue Department and Statistics Office, 2009)

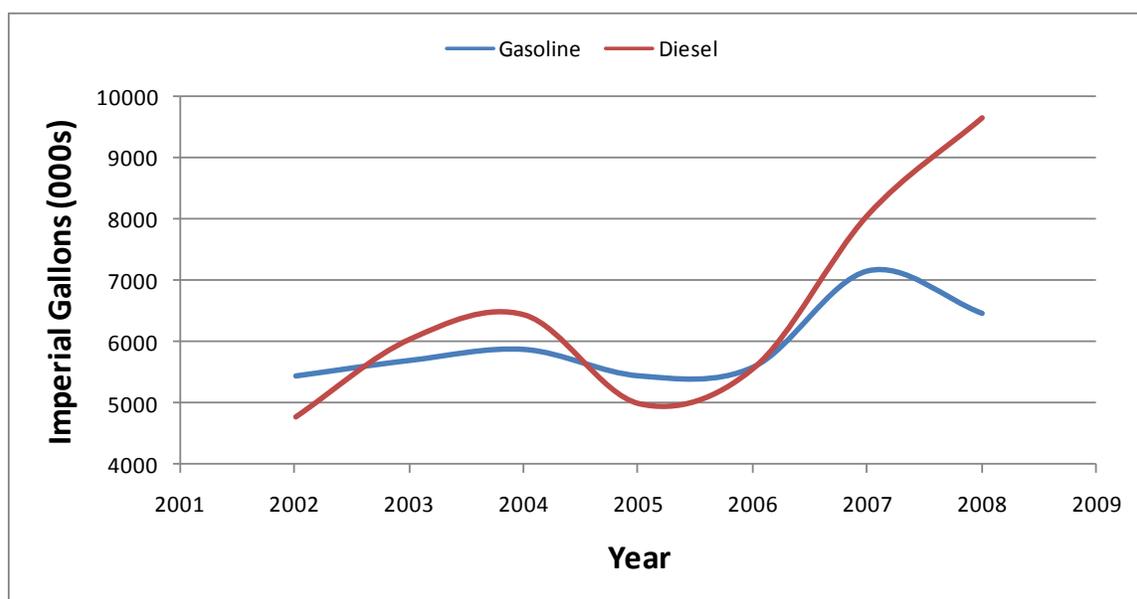

Figure 20. Imported diesel and gasoline per year for other uses aside electricity generation (Source: Statistics Office, VINLEC)

The average age of the vehicle fleet is rather high, hence contributing to higher fuel consumption, combined with the lack of emissions monitoring and regular engine maintenance requirements, a low performing public transport system, mediocre road conditions, and poor traffic management.

Between 1998 and 2008, about 1400 cars were imported every year on average, with a high share of second-hand vehicles. There is also a tendency to import large-size vehicles with higher fuel consumption (low mileage per gallon). Small-size light-weight cars with efficient low-consuming engines and motor-cycles are not very common.

2.4 Renewable energy sources

SVG has substantial renewable energy sources to provide for heat (solar thermal, biomass), electricity (wind, geothermal, hydro, and solar) and possibly fuel (biomass). While these resources offer the potential to supply a large share of future energy needs, only hydro (see 2.2.1 above) and solar (water heating systems) energy are being tapped.

Hydro power - is only used on the island of Saint Vincent and has a total installed capacity of 5.6 MW, of which only about 5.2 MW are available. In 2008 it provided around 20% of VINLEC's gross electricity production in St. Vincent. Due to varying precipitation over the year, the constantly available capacity (firm capacity) is far lower than the rated capacity and amounts to about 2 MW at present. The hydro power facilities at South Rivers (3 turbines with a total rated capacity of 0.87 MW) and Richmond (2 turbines with a total of 1.1 MW rated capacity) were built in the late 1950's and early 1960's respectively. The plant at Cumberland was built between 1987 and 1988 (5 turbines with a total of 3.7 MW). All of the installations are of the run-of-river type.

According to preliminary studies prepared with support from the German Agency for Technical Cooperation (GTZ) in the context of the Caribbean Renewable Energy Development Programme (CREDP), further potential exists for additional hydro power exploitation through rehabilitation and expansion of existing plants and development of new sites. In 2009, a comprehensive feasibility study was carried out for the rehabilitation of the Richmond and South Rivers plants, and the development of a second plant along the Colonaire River, downstream of the existing South Rivers plant. The rehabilitation and the expansion projects were both found to be technically and economically feasible. Tendering processes for these projects should commence in 2010.

The conservative estimate of the unused hydro power potential is in the range of 5 to 10 MW from the rivers of Wallibou and Buccament. There are plans to install river flow gauging equipment at the Wallibou River in 2010 in order to record the long-term flow characteristics of the river.

The use of solar water heaters (SWH) is not widespread. The systems are imported from Barbados and are commonly found in large residential buildings. Their deployment should be expanded throughout all sectors, so that the island's entire hot water demand is supplied exclusively through solar energy.

There is considerable wind energy potential mainly on the eastern side of Saint Vincent and Bequia, and on all of the smaller islands. Wind power has been traditionally utilized to grind grains.

With assistance from CREDP/GTZ, VINLEC has identified potential wind sites for small wind parks. Since September 2005, VINLEC has been collecting data on wind speeds at a site in Brighton. The measured annual average wind speed at 10 metres is of 7.8 m/s. Higher wind speeds are reached at 40 to 50 metres, which is the average hub height of a standard wind turbine suitable for Saint Vincent. Another wind measurement tower has

been operating at Ribishi Point, close to the Brighton landfill site, since March 2007. There, wind speeds and directions are being recorded at 10 and 30 metres. At 30 metres, the annual average wind speed is in excess of 8.9 m/s. A third wind measurement tower at Belle Isle has been recording wind speed data at 10 metres since 2007. However, the wind regime at this location has been determined not to be favourable for wind park development. Currently, VINLEC is considering the options of partnering with a private investor to build a wind park at Ribishi Point or building the facility on its own.

Biomass resources are mainly exploited in a non-sustainable manner through the use of charcoal. There are no known biogas plants or other applied technologies that make use of biomass resources in a modern way. The potential to extract oil from coconuts or other seeds (like *Jatropha curcas* – also known as “Barbados nut” in the region) and use this oil either in its pure form, or transform it into biodiesel, has so far not been examined. In 2009 GFA Envest GmbH in collaboration with Caribbean Bio-Energy Technology Ltd. (CBET) concluded a feasibility study that examined the use of available agricultural and municipal biomass resources for the production of electricity using biogas plants. The study concluded, among other things, that while considerable biomass residues are currently available in SVG, their quality is not sufficient for imminent use in biogas plants. The study further examined the possibility to run a biogas plant based on a mixture of input substrates consisting mainly of energy crops that can be produced on available idle agricultural land in SVG and by a shift in markets of actual cultivated land. The results of the study were presented to the National Energy Committee, the Ministry of Agriculture and other energy stakeholders. A source of development funding for implementation of an initial phase of a recommended biogas plant is needed.

Geothermal power offers the potential to supply all of the base load electricity demand on mainland Saint Vincent and, through interconnections, to the Grenadine islands and to other neighbouring islands. Although the Government has undertaken a number of preliminary investigations of geothermal resources in St. Vincent over the last 15 years, the actual potential is yet to be proven by slim-hole drilling. The Government is currently considering further proposals that will lead to suitable development of the geothermal resources in Saint Vincent. The Government signed a Memorandum of Understanding (MoU) in 2008 with a potential private developer to facilitate negotiation of a geothermal exploration and exploitation agreement (GEA). By January 2010, the Government completed its review of a proposed GEA and signed the agreement that grants the developer the exclusive right to investigate and develop the resources within a specified geothermal area and to operate the project.

III. Summary of Reference Case Business-as- Usual (BaU)

In a business-as-usual scenario where electricity consumption is left unchecked (i.e., without any kind of Government action or intervention), it is estimated that massive investments in the order of EC\$ 70-100 million would be needed by 2015¹⁹ to commission new power generation facilities, rehabilitate or replace old power stations and enhance the distribution system. Energy consumption will also increase in all other sectors at a rate equal or greater than GDP growth as recently experienced, and it will rely increasingly on the import of fossil fuels (mainly petroleum derivatives). Such development will create a heavy burden on the national budget as well as on the private, public and commercial sectors for purchasing/accessing any kind of energy.

According to VINLEC, if the Government does not take action to diversify energy sources, seek for long-term energy security and promote energy efficiency, the energy sector will develop as follows²⁰:

- Peak electricity demand will be 27 MW on the island of Saint Vincent by 2015 and 31 MW by 2020, together with reserve power requiring an installed capacity of 48 MW and 55 MW respectively.
- Additional capacity will be based on diesel-powered generators and/or heavy fuel oil (HFO).
- Gross Electricity generation will rise to 158 GWh by 2015 and 184 GWh by 2020 (VINLEC, 2009), leading to an additional requirement of 1 million imperial gallons of diesel imports by 2015 and more than 3 million imperial gallons by 2020 (assuming that all new generation comes from diesel gensets). Consequently, CO₂ emissions will also augment.
- For the smaller islands of SVG it is also projected that electricity consumption and load will increase over the next decade at a rate of 3% to 4% per year.
- The number of vehicles²¹ is projected to increase at a 2% rate per year (i.e. ~10,000 more cars will be imported by 2015). Meanwhile, fuel consumption in the transport sector will continue increasing as well, reaching 13 million imperial gallons of diesel and 8.3 million imperial gallons of gasoline by 2015, based on observed behaviour in the last years and expected increase in the transport fleet.

¹⁹ Based on current investments made by VINLEC and projected growth of the power sector

²⁰ As it relates to projected development in the electricity sector only.

²¹ There is a considerable discrepancy between values reported by the Licensing Department and Statistics Office.

According to VINLEC’s projections, the following scenarios reflect the development of gross electricity generation and expected peak demand behaviour in coming years; see Figure 21 and Figure 22.

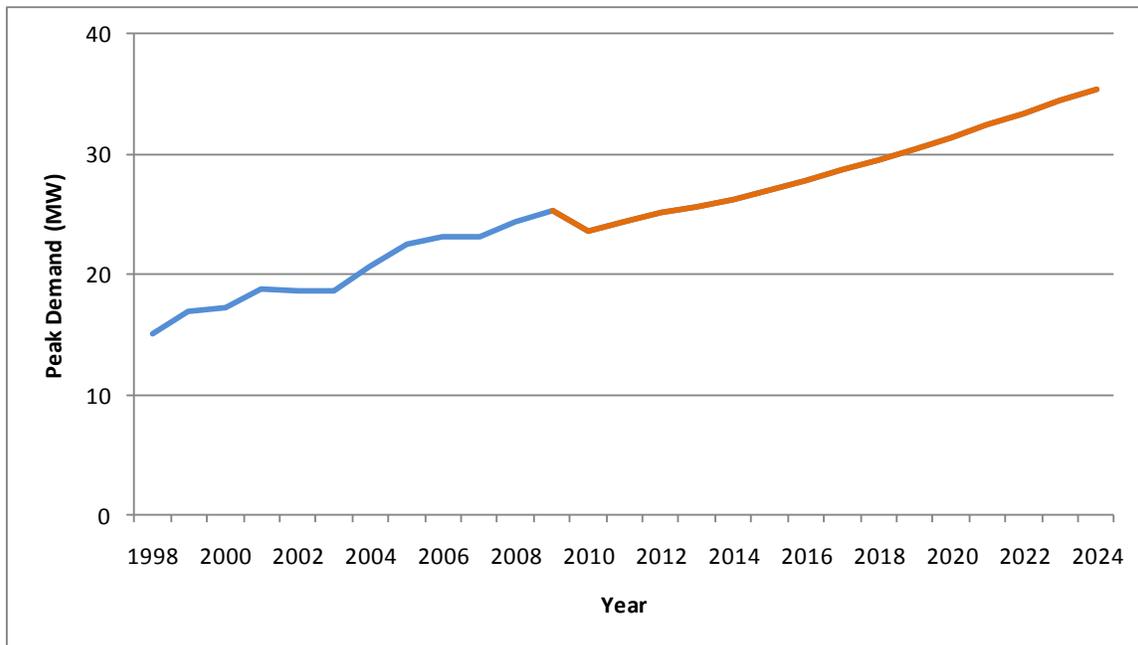

Figure 21. Peak demand VINLEC’s Scenario in SVG

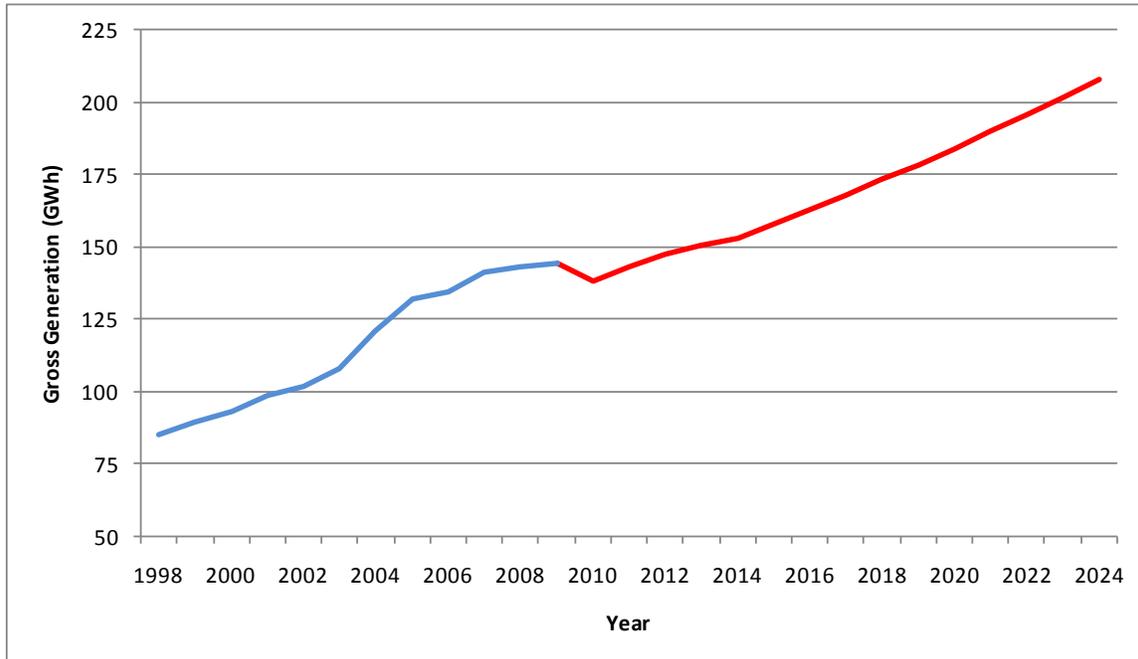

Figure 22. Electricity Gross Generation VINLEC’s Scenario in SVG

In the last ten years (1998-2007) electricity demand has grown yearly by an average of 5.4% in the domestic sector, 7.7% in the commercial sector, 1.1% in the industrial sector and 4% in street lighting. Meanwhile, peak demand growth has been 5% per year. For

this reason it is imperative to **focus on actions in the commercial and domestic sectors**. Complementary activities should be undertaken in the industry sector and with regard to the street lighting infrastructure.

IV. Energy Action Plan

The purpose of this section is to outline the actions for SVG's energy future from 2009 until 2030. It contains short (1-5 years), medium (5-10 years), and long (10-20 years) term actions designed to enhance the implementation of the policies and goals of Saint Vincent and the Grenadines' National Energy Policy (NEP). The NEP envisages improvement in the reliability, accessibility, equitable access and affordability of energy supplies, ensuring energy security, promoting energy conservation, energy efficiency, use of indigenous resources, and diversification of energy sources and energy use sectors.

4.1 Planning and management

GOAL: Consolidate well coordinated planning and management programmes to achieve sustainable supply and use of energy by 2015

4.1.1 Institutional requirements

The Prime Minister took over the energy portfolio in 2006. Subsequently, he established a National Energy Committee in 2006 and an Energy Unit in 2008 for the development and implementation of the National Energy Policy, which was adopted by Cabinet in February 2009. The Prime Minister, in his function as Minister of Finance, is also responsible for the control of fuel prices. The Government has therefore established structures that allow for concentrated efforts needed to reshape the energy sector and formulate decisions in an effective and linear approach. It will now be necessary to strengthen staff capability to deal with all types of energy policy matters as well as promotional and information activities.

Action 1: The Cabinet will decide which agencies of Government (e.g., Ministry of Energy, other ministries, state institutions or companies, VINLEC, Bureau of Standards, etc.) are responsible for energy issues. The Cabinet will base its decision on the advice of the National Energy Committee composed by different ministries and national stakeholders, and presided by the Office of the Prime Minister. The Government will undertake efforts to strengthen the knowledge of its staff on all energy-related issues. The Energy Unit will be responsible of coordinating actions with the different entities and individuals.

Time-scale: Short-term

4.1.2 Energy database and publication of annual energy statistics

For the development of a long-term energy strategy, and the planning of the electricity supply, it is essential to have reliable knowledge of the status and history of energy supply and consumption in different sectors, and data related to those sectors such as the number and type of vehicles, the use of electric water heaters, energy consumption patterns in different sectors, etc. Such statistical data are currently not available, or are

spread among different market participants. A full-scale energy balance is currently not available, while other energy-related figures are either unregistered or out-of-date.

Action 2: The **Office of Statistics** will establish procedures for improving retrieval of up-to-date and relevant energy data from several market participants. The information shall be utilized to produce statistical data and materials on energy supply and consumption which the Office of Statistics will compile annually in an energy balance. The annual energy balance shall be made available to the public through different media, including the Internet, and shall provide reliable information on the state of energy supply and consumption for each sector of the economy. These activities shall assist the Government in ensuring, and following up with, the compliance of energy targets.

Time-scale: Short-term

4.1.3 Capacity building, education and awareness raising

Capacity building, institutional strengthening and awareness raising are fundamental aspects of any sustainable energy strategy.

Action 3: The **Ministry of Education** will propose a strategy for the implementation of energy-related capacity building activities at all levels of education, from primary schools to colleges and universities. It will provide financial support for advanced professional training, particularly in the field of renewable energy applications and general awareness raising, and will seek the participation and financing of national stakeholders and international donors.

Time-scale: Short-term

4.1.4 Pilot and demonstration projects

Pilot and demonstration projects are a valuable and convincing tool to showcase how energy efficiency and renewable energy technologies can be implemented, and show positive results with regard to economic and ecological effects. The Government is therefore determined to select and support such projects that have a high potential to raise awareness and act as a model for subsequent actions by the private and/or public sector.

Action 4: The **Ministry in charge of Energy**, in cooperation with the Ministry of Finance and Economic Planning, will examine ways to set up a fund in support of small-scale pilot and demonstration projects to showcase new ways to enhance energy efficiency or introduce renewable energies.

Time-scale: Short-term

Action 5: The **Ministry in charge of Energy and the International Airport Development Company (IADC)** will ensure that the new

International Airport at Argyle is built in the most energy efficient manner possible, by erecting well-insulated buildings and using natural ventilation and properly designed day-lighting. The Government will also consider the use of roof-integrated solar electricity and solar thermal systems in combination with absorption cooling and energy efficient artificial lighting, acting as a show-case for the nation and the region.

Time-scale: Short-term

4.1.5 Interconnection

Based on a preliminary study developed by VINLEC in early 2009, interconnection with the Grenadines islands is not a cost-effective alternative. Nonetheless, there is an expression of interest to determine when interconnection between islands of the country would become a feasible alternative. Moreover, the materialization of geothermal development can bring SVG the opportunity to export electricity where interconnectivity with other island states is a realistic option.

Action 6: The **Ministry in charge of Energy**, in collaboration with VINLEC, will investigate opportunities for electrical interconnection between and among different islands of the country, and with neighbouring states, and take notice of results from studies being developed by international organisations.

Time-scale: Long-term

4.1.6 Environmental impact assessment

Renewable energy and conventional energy projects must be set up without disturbing and harming the environment (air and water pollution, loss of biodiversity among others). For example, an environmental impact assessment should provide evidence that no major negative influence on the local communities and species will occur from erecting and operating wind farms of more than three turbines. The impact of new hydropower plants on the environment can also be minimized by using adequate technologies and design solutions. Energy projects should focus first on those locations with the least intrinsic human and wildlife habitat values.

Action 7: The **Ministry of Health & the Environment** will make itself familiar with the requirements and standards of environmental impact assessments for geothermal, solar, wind farms, hydropower facilities, and any new energy project, and build sufficient capacity in this area. In the shortest time possible, it will establish guidelines for such studies and seek assistance from international experts if necessary. Environmental impacts caused by renewable energy plants will be compared to impacts of fossil-fuel based plants.

Time-scale: Short-term

4.1.7 International cooperation and financing

The transformation and modernization of the energy sector will require financial means that exceed the national budget of SVG, VINLEC and the private sector can provide much needed capital and help reduce the financial burden on the Government. Therefore, it will be necessary to seek, attract and retain international financing and funding sources for investments, pilot actions, institutional and capacity building as well as information activities. It will be easier to attract private investors if additional financing sources with preferential conditions can be made available.

Such sources can be the European Development Fund (EDF), the Caribbean Development Bank (CDB), the Inter-American Development Bank (IDB), the World Bank, the German Development Bank KfW and other donors and financing institutions. Credits for the avoidance of greenhouse gas emissions could possibly be obtained and sold through the Clean Development Mechanism (CDM), if major renewable energy or energy efficiency projects in the region are bundled.

Action 8: The **Ministry in charge of Energy** will get in contact with international donor and financing institutions in order to access additional funding sources for investments on energy efficiency and renewable energy measures. It will also draft applications for such purpose and assist the private sector in accessing financing packages that would make investments competitive and financially attractive. Grant funding from the European Development Fund within the Special Framework of Assistance (SFA), which has already been approved, will be used mainly to further implement the National Energy Policy and put different activities into effect, specifically with regards to energy efficiency.

Time-scale: Short-term

4.1.8 Financial incentives

Energy efficient products still have in many cases higher costs than similar products with low efficiency. Renewable energy technologies generally show relatively high up-front investment costs, but require far lower operation and maintenance costs than conventional technologies. Therefore, to overcome the obstacle of high initial costs and stimulate the market for innovative energy technologies it is recommended to provide financial (grants or soft-loans) or fiscal (tax credits, reduction or exemption from duty taxes and consumption taxes etc.) incentives. Currently incandescent light bulbs are taxed with 100% excise tax and 15% Value Added Tax (VAT), while compact fluorescent lamps (CFLs) are fully exempted from excise tax and VAT.

Action 9: The **Ministry of Finance and Economic Planning** will select a list of items that will be completely or partially exempted from import or consumption taxes, while higher taxes may be imposed on energy inefficient devices. Such list will include systems and components which

contribute directly to improve energy efficiency or the use of renewable energy sources. It will also consider a scheme of tax credits to the benefit of all legitimate persons and companies that make investments in energy efficiency measures or for the use of renewable energy sources. The Ministry of Finance and Economic Planning will also reconsider the current exemption from Value Added Tax (VAT) for electricity, gasoline, kerosene, diesel and LPG.

Time-scale: Short-term

4.1.9 Monitoring and evaluation

In order to verify if the overall targets will be achieved and appropriate actions are being taken, a continuous monitoring and evaluation process will be needed. This provides the Government with the information necessary to adopt its policy over time and take up additional adjustment measures if required. It will further secure that Parliament and the general public are informed about the effects and results of actions implemented within the National Energy Policy.

Action 10: The **Ministry in charge of Energy**, with support from other relevant Ministries, public institutions and VINLEC, will report biannually on the status and outcomes resulting from the implementation of the actions, The Ministry in charge of Energy will revise the energy action plan accordingly if required, to meet the overall energy targets or to adapt to new political conditions. The biannual status report shall be made available to the public through different media, including the Internet.

Time-scale: Short-term (long-term continuance)

4.2 Power sector

GOAL: Reduce projected increase in peak demand by 5% by 2015 and 10% by 2020, and strive to reduce power losses down to a total of 7% by 2015 and 5% by 2020.

4.2.1 Long-term planning for the electricity sector

The effective use of financial capital and the security of electricity supply rely mostly on a long-term integrated design and interdisciplinary planning process, taking into account forecasts on energy demand, price volatility, availability of primary resources, grid enhancement and extension, power capacity development, electricity consumption, among other considerations in the sector.

Action 11: Every two years, VINLEC will design and review a 10-year planning prospect for the electricity sector, and discuss the results with the Government.

Time-scale: Short-term (long-term continuance)

4.2.2 Tariff structures

The high electricity prices for industrial and commercial customers in combination with inequities in the formula for computation of the Demand Charge have put a heavy burden on many such consumers and given indication that prices do not fully reflect costs.

Action 12: VINLEC conducted a Cost of Service Study on 2010. The study analyses, among other things, the cost and tariff structures of the utility. Based on this study, VINLEC will be requested to submit a more equitable formula for imposing the demand charge, in particular for the commercial sector. VINLEC will be requested to look at ways on how tariff structures could better reflect real costs.

Time-scale: Short-term

4.2.3 Demand side management

There is high potential for energy conservation and efficiency in the manufacturing industry, as well as, in the commercial and domestic sector. To tap this potential, energy audits and technical advice to different types of customers regarding the potential to improve their energy consumption patterns is needed. Further, new financing mechanisms that allow for carrying the initial investment costs are needed.

Action 13: The **Ministry in charge of Energy**, with support from VINLEC, will initiate a programme for improved demand side management by offering low- or no-cost services for energy audits to major electricity consumers. VINLEC will also offer, whenever this is feasible, low-interest loans for the purchase of energy efficient devices, or pre-payment schemes for the purchase of such goods (e.g., solar water heaters and CFLs), where credits are repaid through the cost savings on the electricity bill. Mainly for domestic and commercial customers, the Ministry in charge of Energy will consider to set up an information and advisory centre, and produce adequate publications to inform about ways for smart and cost-saving energy use.

Time-scale: Medium-term

4.3 Renewable energy

GOAL: Deliver 30% of projected total electricity output from Renewable Energy Sources (RES) by 2015 and 60% by 2020

Preliminary findings show that several sources of renewable energy can be exploited at costs that are competitive with conventional power sources, as long as no major investments have to be made for infrastructural improvements, such as road construction

or grid extension and reinforcement (e.g., generation costs for wind energy could be lower than EC\$ 0.20/kWh, well below the current fuel acquisition cost of about EC\$ 0.28/kWh). For rehabilitation of the older hydro power plants, estimations show that generation costs would also be in a similar range. Despite their high up-front costs, both hydro and wind power have the advantage that operational costs are low; therefore their price stability is high. Wind turbines usually have a life span of at least 20 years if properly monitored and maintained. Hydropower plants can run for more than 40 years, if overhauled regularly.

Several actions must take place for a rapid and successful deployment of renewable energy technologies. To expand the use of renewable energy sources it is critical to ascertain where key project opportunities exist. Within the framework of the Caribbean Renewable Energy Development Programme (CREDP), executed with support of GTZ/Germany, there is an ongoing process of measuring and assessing potentials for the exploitation of wind and hydro power resources in collaboration with VINLEC.

Furthermore, there is a need to take a closer look into the potential for biomass and geothermal energy. Given the large increase of global production capacity for solar cells and modules, photovoltaic systems have seen a sharp decline in price in the first half of 2009, which are 30% lower than at the end of 2008. In particular situations, such as off-grid supply, and with increasing oil prices, solar electricity can already compete with fossil fuel power generation. Besides the main island of Saint Vincent, assessments should also cover the smaller inhabited islands of the Grenadines.

4.3.1 Renewable Energy Resource potentials

4.3.1.1 Geothermal

The accurate assessment of geothermal energy potential for electricity generation depends on explorations involving the drilling of boreholes, which is an expensive process that can only be carried out either with international financial support, or by the private sector interested in exploiting these resources. In May 2008, the Government signed a Memorandum of Understanding (MoU) effectively granting exclusive rights to a private company, for a period of 12 months, to negotiate an agreement with the Government for the development of geothermal energy resources within an initial Geothermal Resource Area defined in the MoU. The expiration date of the MoU was extended to December 2009 to facilitate conclusion of the negotiations. The Government, after several years of negotiation, made an exclusive agreement with a private entity to develop, explore and exploit geothermal resources.

Action 14: The **Ministry in charge of Energy** and Cabinet shall ensure sustainable development of exclusive geothermal exploration and exploitation in the Soufriere Resource Area on mainland Saint Vincent, in accordance to the signed agreement. If the initial explorations yield positive results, the exploitation of such geothermal resources shall be in a

fashion that benefits the nation. The Ministry in charge of Energy will ensure that such exclusive agreement entered into with the private developer is followed accordingly and that in the event that the developer fails to comply with its duties and obligations in a timely manner and to the extent agreed, the Government can invoke explicit termination clauses at various stages of the development process to terminate the agreement.

Time-scale: Short-term

4.3.1.2 Hydro power

VINLEC commissioned a comprehensive feasibility study in 2009 with funding from the Caribbean Renewable Energy Technical Assistance Facility (CRETAF) to validate the results of previous studies conducted with assistance from CREDP/GTZ. The studies have concluded potential for raising the capacity and gaining additional output of 27% and 13% respectively above the current average annual electricity production at the Richmond and South Rivers hydro plants. The new study examined the civil and electromechanical structures at the plants, the topography of the surrounding rivers and plant sites and the environmental and social impact to renew and maximize the output of the plants.

The results showed that most of the civil and electromechanical equipment can be replaced at a cost of US\$ 8-8.5 Millions to gain increased energy output of 13% and 10% above the current average annual electricity production of the Richmond and South Rivers plants respectively. The potential of the sites can yield greater gains of 24% and 46% respectively but the environmental and social impact assessments indicate that this additional yield will require use of residual water flows necessary to sustain aquatic life and social activities.

The scope was later expanded to include the feasibility of developing a second stage hydropower plant downstream of the existing South Rivers hydropower station. The proposed capacity is 1.19 MW with an annual energy output of 4,870 MWh. This would increase the energy output from South Rivers to 8,930 MWh which is a 120% increase above the current average annual electricity production of the South Rivers Power Station. The new study concluded that such rehabilitation works would be economically and financially viable, even by basing the calculation on a conservative future oil price of US\$ 60 per barrel.

The CRETAF funding also provided for the preparation of Tender Designs and Tender Documents which should be of sufficient detail to use in the tendering process to secure Contractors from the international market to supply material, equipment and labour to upgrade and build these power stations.

The previous feasibility studies on hydro energy potential have also pointed to the need for long-term flow measurements by installing or re-installing river gauging stations at the existing hydro power stations, as well as, at potential new hydro power sites. Furthermore, it is assumed that untapped rivers at Fancy, as well as larger rivers like

Wallibou, Buccament and Rabacca, offer additional hydro power resources of significance.

Even if no immediate development of further new sites is considered, assessing the potential of other hydro power locations is urgently required in the interest of securing a future sustainable energy mix in SVG. Considering that reliable hydrological data should be based on data collection over 10- to 20-year periods, a comprehensive river gauging programme should be started without further delay as an investment into the future.

A hydrometeorologic network has been erected in the framework of the National Water Resource Management Study Programme (NWRMSP) supported by the European Development Fund (EDF). The NWRM study is assessing the water resources of all the islands used as potable water and for irrigation and hydro power purposes, in collaboration with the Central Water and Sewerage Authority (CWSA). VINLEC is contributing to the study, which was started in fall 2006 and will end in 2010.

Future of hydropower production depends mainly on the long-term availability of sufficient water resources. River flows are threatened by deforestation, variation of annual precipitations caused by climate change and competing uses, like fresh water supply and irrigation.

Canouan, Union, Bequia and other Grenadine islands do not have substantial rivers, and their annual rainfall ranges from 900 to 1,600 millimetres. Therefore, there are no suitable locations for hydro power production.

Action 15: VINLEC, in collaboration with the Government and initially assisted through the Caribbean Renewable Energy Development Programme (CREDP/GTZ), will select appropriate river sites for possible future hydro power plants and start a long-term gauging programme in order to get reliable hydrological data that cover various seasons and give sufficient evidence on the medium availability of water for run-of-river power stations. Such undertaking will be done in collaboration with, and on the basis of, the NWRMSP. The Hydrometeorologic Unit established under CWSA will be supported for all long term water resource measurements in Saint Vincent and the Grenadines in order to ensure the future provision of hydrometric data. Formerly established measuring stations will be reinstated if possible. The Government, VINLEC and CWSA will ensure the sustainability of the Hydrometeorologic Unit; in such way ensure an integral management of water resources exploitable for hydro power generation. Moreover, in the shortest time possible the Government through the Ministry of Agriculture and Forestry together with the NWRMSP shall design a plan for land reforestation in hydrological sensible areas and establish guidelines for a long-term sustainable forest management, including the creation of preserved areas and buffer zones in which unregulated logging will not be allowed.

Time-scale: Short to long-term

Action 16: The **Government** through the Ministry in charge of Energy will request VINLEC to provide the financial means for the rehabilitation of the hydro power plants at South River and Richmond, and for the installation of new small hydro power plants. The Ministry in charge of Energy and the Ministry of Finance and Economic Planning will assist in finding adequate financing sources and secure bank guarantees.

Time-scale: Short to medium-term

4.3.1.3 Wind energy

Preliminary findings show that there is technical potential in the range of several MW coming from wind energy in Saint Vincent and some of the smaller islands. Previous wind measurements in Saint Vincent have indicated mean wind speeds of 7-8 m/s on eastward facing ridges. Bequia and Union Island both have good potential sites, with estimated annual mean wind speeds of 7-8 m/s on eastward facing ridges. The island of Canouan has an excellent wind regime with annual averages estimated to be above 8 m/s. Mayreau has a very similar wind regime, and a small wind-diesel hybrid system could provide the island with relatively cheap power.

A supplementary use for wind energy is the production of fresh water by desalination using reverse osmosis, currently in preparation for Bequia under the Implementation of Adaptation Measures in Coastal Zones Project, with grants from the Global Environment Facility and under responsibility of the Ministry of Health and Environment.²²

Precise wind measurements are currently made by CREDP/GTZ and VINLEC at Brighton and at Ribishi Point on the island of St. Vincent to get reliable data for wind power investments. The ridge at Ribishi Point, close to the sea and between a landfill and a new sanitation facility, is a good location for a small 4 to 5 MW wind farm using turbines with a capacity of approximately 900 kW. VINLEC has evaluated tenders for the supply and operation of wind turbines at these locations in 2009. VINLEC is considering either entering into an agreement with one of the tender proposals or investing in the development of the wind park on its own. Further wind measurements are needed to select other locations for future wind farms.

Action 17: **VINLEC**, with technical assistance from CREDP/GTZ, will execute further long-term wind measurements on St. Vincent. Measurement activities will be extended to other islands with good wind potential and demand for wind power. Environmental impacts and ground conditions for turbine foundations should be assessed at selected sites, and technical and economical pre-feasibility studies should be executed.

Time-scale: Short - Term (long-term continuance)

²² See World Bank Report 34152-LAC of August 8, 2006

Action 18: The **Ministry for Physical Development** and **VINLEC** will initiate steps for the erection of wind turbines and posts for grid-connection as soon as possible. They will further make arrangements to allow conditional access and use of this property either by VINLEC or a private wind farm operator. The Ministry for Physical Development will initiate a process of land use planning, dedicating and reserving sites for the construction of additional future wind farms.

Time-scale: Short-term (long-term continuance)

4.3.1.4 Biomass energy and waste-to-energy

An assessment of the potential of different biomass residues and the availability of plants dedicated to electricity generation from biogas was concluded in March 2009 by GFA Envest GmbH in collaboration with the Caribbean Bio-Energy Technology Ltd. and the Government. The study identified some feedstock, such as banana trunks, that can be used for the production of biogas, and also examined to what extent the organic content of agricultural and municipal waste can be utilized for the same purpose. The study estimates that the realistic potential for electricity generation from biogas in Saint Vincent is within 3 to 4 MW, and outlines a project concept for the initial development of a biogas plant. Further assessment will be needed to examine to what extent oil-containing seeds and/or other biomass sources can be used as the basis of biofuels for the transport sector and other purposes, such as cooking.

Action 19: The **Government through its Energy Unit, in collaboration with VINLEC and the Ministry of Agriculture, Forestry and Fisheries** will continue to dialogue and partner with interested private developers to seek funding for the development of a biogas plant for electricity generation, and also to further analyse the potential of using available biomass sources to produce biofuels for the transport sector and other energy purposes.

Time-scale: Short-term

4.3.1.5 Solar electricity and solar thermal use

The potential for hot water and electricity generation depends mainly on the usable size (surface) of the appliances (collectors or panels) and the technology used. Medium solar radiation is of 5.0 kWh/d.m² throughout the region and shows little seasonal variation. There is a significant use of electrical water heaters that could be replaced by solar collectors. There are a growing number of applications where photovoltaic panels can be used at competitive costs. Those options may increase significantly with the continuing decline in price of solar photovoltaic systems.

Action 20: The **Ministry in charge of Energy**, in collaboration with **VINLEC**, will analyse market potentials for the (extended) application of solar thermal and solar photovoltaic systems in all sectors. Through the

Energy Unit, the Ministry of Energy will continue to examine the potential to fit grid-connected photovoltaic installations on government and public buildings through the initial installation of demonstration systems on at least three buildings that were investigated with assistance from CREDP/GTZ. VINLEC will install a pilot photovoltaic plant at its own premises and will publish technical guidelines for the interconnection of small, grid-connected renewable energy systems.

Time-scale: Short-term

4.3.2 Applications

4.3.2.1 Renewable energy for the Grenadine islands

Given their remoteness and small power demand, electricity generation costs on Bequia, Canouan, Union and Mayreau are even higher than on the main island. On the other hand, those islands have a strong seasonal tourism sector that requires clean energy services and competitive energy costs. Those islands have an excellent potential of wind as well as solar resources. This is also the case for the other smaller islands that have privately operated diesel-fired electricity systems.

Action 21: The **Ministry in charge of Energy**, with technical and financial support from international sources, will investigate opportunities to tap cost-effectively wind and solar potentials for electricity generation on all major Grenadine islands. This includes the centralised use of such sources to be fed into the grid in addition to the decentralised generation coupled with either storage systems or grid-connections to deliver excess electricity. The Government through its Energy Unit will also seek international financial funding for feasibility and planning studies as well as investments in the form of grants or soft-loans to raise the economic viability and lower financial risks to support private power operators to replace diesel fuel with RES.

Time-scale: Short-term

4.3.2.2 Renewable energy for self supply

Stand-alone photovoltaic panels or small wind generators in combination with charge controllers and batteries can be the most economical solution for specific applications if a grid connection is not available or would be too expensive.

Action 22: The **Ministry in charge of Energy**, in collaboration with VINLEC and other public institutions, will investigate opportunities for the installation of stand-alone photovoltaic and wind power systems. Application areas could include street lighting, air field lighting, cattle fences, telecommunication towers etc. The Government through its Energy Unit will consider how to promote private investments and provide

appropriate technical information.

Time-scale: Short-term

4.3.3 Stimulus tools

4.3.3.1 Independent power production

Currently the Electricity Supply Act (ESA) does not allow for the engagement of Independent Power Producers in SVG, unless they have been authorized by VINLEC and with the consent of the Ministry responsible for electricity supply. However, given the high investment costs required for the construction of new generation facilities, which may exceed VINLEC's financial capabilities, the participation of new and experienced stakeholders in the exploitation of new wind and geothermal resources could be essential for the deployment of new generation facilities of this type.

Action 23: The **Ministry in charge of Energy** will either amend the Electricity Supply Act to allow electricity generation from renewable energy sources by Independent Power Producers (IPP), or mandate VINLEC to issue sub-licences for electricity generation subject to proven techno-economic and environmental feasibility as well as socio-economic benefits. VINLEC will maintain its role as sole-buyer, transmitter and distributor of electricity in the country. It will purchase the power generated exclusively from renewable energy sources from any IPP on the basis of long-term bilateral Power Purchase Agreements (PPA). The Government will act as supervisor in this process, unless a neutral regulatory body is delegated with such power.

Time-scale: Short-term

4.3.3.2 Net-metering

Currently the parallel operation with the public grid and feed-in of excess electricity is not allowed without prior licensing by VINLEC even in cases where renewable energy is used for self-supply, or produced at small-scale. On the other hand, net-metering schemes for small electricity generators using renewable energy have not yet been officially established. A first grid-connected PV installation based on a bilateral net-metering agreement with VINLEC has gone into operation at the Saint Vincent Technical College in May 2008.

Action 24: The **Ministry in charge of Energy** will change the legal basis to allow for indiscriminate supply of electricity to the main grid from small generators using renewable energy, without prior licensing by VINLEC. The Government through its Energy Committee, in collaboration with VINLEC, will also implement a suitable net-metering scheme for such electricity.

Time-scale: Short-term

4.4 Petroleum sector

GOAL: Increase energy security and diversify the energy portfolio

4.4.1 Contracts and agreements for energy supply and storage

SVG traditionally imports petroleum supplies from Trinidad and, as necessary, purchases on the spot market. Oil reserves in the Latin American and Caribbean region are estimated at 52.5 to 129 billion barrels (Gb),²³ while natural gas reserves are estimated at 250 trillion cubic feet. Within the vicinity of SVG, only Venezuela possesses long-term petroleum resources.

Over the years, SVG has benefitted from energy agreements, such as the Petrocaribe and Texaco, which form an important part of the energy security strategy and involve access to refined petroleum products under special financing conditions.

Action 25: It is important for the country to preserve benefits negotiated under bilateral energy supply agreements. The Government's foreign trade policy will seek to strengthen bilateral relationships with energy supplying countries within, and outside of, the region, such as the petroleum supply contract signed with the Government of Venezuela under the auspices of the PetroCaribe Agreement. The Government, in line with other countries of the region, will further support any policy that seeks to set up new refinery capacities in addition to existing facilities, if such option demonstrates clear economic advantages and is consistent with existing socio-environmental regulations.

Time-scale: Short-term (long-term continuance)

4.4.2 Petroleum reserve storage

Unexpected oil supply disruptions due to national or international events, such as natural disasters, geopolitical instability, or acts of terrorism, must be prevented. With the commissioning of the first phase of the new diesel generating plant at Lowmans Bay in 2006, VINLEC created 440,000 imperial gallons of fuel storage capacity to operate the plant. An additional 440,000 imperial gallons is to be added with the second phase of expansion of the plant scheduled for 2010. Additionally, the Government, through the PetroCaribe Agreement, is in the process of constructing a national fuel storage facility at Lowmans Bay that will expand storage capacity for petroleum products including possibly fuel for the transport sector and LPG.

²³ Energy Watch Group. Crude Oil – The supply Outlook. Revised Edition February 2008.

Action 26: The **Ministry of Foreign Affairs, Commerce & Trade** together with the **Energy Unit** will revise existing regulations, or submit for consideration new legislation to Parliament, in order to ensure adequate inventory levels to cushion effects of supply disruptions on fossil fuels.

Time-scale: Medium-term

4.4.3 Diversification of energy sources

Considering the potential for renewable and non-renewable energy development in Saint Vincent and the Grenadines and the current technological advances, energy resources such as liquefied or piped natural gas, biomass, wind, geothermal, solar and other sources of energy must be considered in the future energy mix. Furthermore, it is essential to explore interconnection options between and among Saint Vincent, the Grenadine islands and neighbouring nations. This strategy would enable the creation of a new export market for excess energy from SVG and strengthen energy security at the national and regional levels.

Action 27: The **Government through its Energy Unit** will promote the diversification of energy sources to reduce SVG's dependence on a single fuel type for the generation of electricity and heat, and for the transport sector. Natural gas and renewable energy sources (see section 4.3 above) are among the alternatives which will be further explored. For such purpose, the Ministry in charge of Energy will mandate the preparation of a study on options to import liquefied or compressed natural gas.

Time-scale: Short-term and long-term

4.5 Transport sector

GOAL: Reduce projected consumption of fossil fuels in the transport sector by 10% by 2015 and 15% by 2020.

4.5.1 Reduced fuel consumption of vehicles

Vehicles vary considerably in fuel consumption depending on engine technology and size. Medium-sized, 5-passenger vehicles show average standard fuel efficiency ranging from 39 to more than 98 kilometres per imperial gallon, the latter being the case of hybrid vehicles. Older vehicles and those without regular engine maintenance generally tend to be less efficient.

Many vehicle owners have no knowledge of the vehicle's specific fuel consumption.²⁴

²⁴ In the case of new vehicles, this information is available from international sources. For example, in the European Union, the United States and Japan, vehicle manufacturers are required by law to provide fuel consumption figures for the vehicles they produce. This allows consumers to make a more informed decision when purchasing a vehicle.

Furthermore, motor vehicle property tax does not take into consideration fuel efficiency. On the other hand, fuel subsidies geared at lowering fuel prices are a heavy burden on the state budget.

Action 28: The **Ministry in charge of Energy**, in collaboration with the Bureau of Standards, will provide the public with specific fuel consumption guidelines for different vehicles commonly imported to SVG. In order to stimulate the purchase of lower fuel consumption vehicles, the **Ministry of Finance and Economic Planning** will revise the motor vehicle taxation system and base it principally on fuel efficiency instead of engine size. The Government will reconsider its policy of subsidizing fuel so as to stimulate the use of more efficient vehicles. It will also assess whether the current environment levy on imported second-hand vehicles is effectively addressing the issue of energy efficiency.

Time-scale: Short-term

4.5.2 Transport strategy

Reducing energy consumption in the transport sector can contribute to achieve a greater level of independence from fossil fuel imports. A new transport strategy should be implemented to lower energy consumption in the transport of goods and persons in the private, industrial, commercial and public sector. Such a strategy should include options aimed at reducing the number of vehicles, improving public transport and road conditions, and implement an innovative traffic management approach.

Action 29: The **Ministry of Transport & Work** will develop a comprehensive long-term transport strategy to curb energy consumption in this sector, including rush-hour regulations, staggered business hours, and access and use of heavy load vehicles during rush hours. It will highlight measures that will reduce the number of road transports, introduce new public buses and regulate public transport routes throughout the island, improve the current road network and make recommendations for innovative traffic management.

Time-scale: Medium to long-term

Action 30: The **Government** through its **Energy Unit**, in cooperation with VINLEC, will study the potential for introducing hybrid and electric vehicles into the island. As a first step, the Government can introduce electric vehicles into its own fleet.

Time-scale: Medium-term

4.5.3 Biofuels for transport

Ethanol can easily be blended with gasoline up to a volume of 10% in most vehicle

engines. Higher ethanol contents can be used in vehicles with modified engines. Biodiesel can also be either mixed with regular diesel, or used as single fuel in many cars. Diesel engines can also be modified to run on pure plant oil.

Action 31: The Government through the **Ministry in charge of Energy** will study the setup of a national (and possibly regional) biofuels production chain. Production would be supplemented with imports from countries such as Brazil if needed. The Government will look into options to cooperate with regional refinery operators and fuel suppliers to set up appropriate supply mechanisms for fuel blends (gasoline/ethanol and diesel/biodiesel).

Time-scale: Short-term

4.6 Energy efficiency

GOAL: Reduce projected electricity generation by 5% by 2015 and 15% by 2020

4.6.1 Assessment of market potential

An analysis of technical potential is required for the energy efficiency market. There are numerous opportunities for electricity savings through conservation, the use of high-efficiency technologies, and better demand management. Statistics on energy demand are scarce, and demand side management has been the subject of little analysis. In order to implement measures for the improvement of energy efficiency and assess their impact on energy supply, there is a strong need to identify and assess key market potentials.

Action 32: The **Ministry in charge of Energy**, in collaboration with stake-holders and with the assistance of regional/international agencies as required, will analyse the structure of the energy consumption sector and its potential for improved efficiency. VINLEC will take over the task of analysing the consumption patterns of different consumer groups, and establish consumer profiles.

Time-scale: Short-term

4.6.2 Co-generation

Hospitals, hotels and the food-processing industry require electricity and heat, the latter being used for hot water, steam and air conditioning. The waste heat occurring in these thermal generation processes can be recovered and transformed into useful energy, thus raising overall efficiency. Decentralized co-generation facilities located at the site of consumption are widely utilized in many developed countries, and should also be deployed in SVG. Electricity would be provided for local consumption, with excess power being delivered to the grid. In this case, as well as in the case of self-generators using renewable energy, remuneration schemes such as net-metering or fixed feed-in

tariffs should be introduced in the legislation by amending the Electricity Supply Act, or through specific legislation.

Action 33: The **Ministry in charge of Energy** will support all activities that contribute to higher energy efficiency by using co-generation facilities in the industrial and service sector. For this purpose, VINLEC will showcase the use of waste heat from its generation facilities in combination with absorption chillers for cooling of its office buildings and work space. The **Ministry in charge of Energy** and/or **Ministry of Legal Affairs** will amend the Electricity Supply Act (ESA) or mandate VINLEC to issue required licenses in order to provide the legal basis for the parallel operation of co-generation plants with the public grid. The Ministry in charge of Energy, in collaboration with VINLEC, will be mandated to analyse the conditions for feed-in of excess electricity and support of back-up and reserve power. Preferential treatment will be given to plants that use sustainably grown biofuels as their main feedstock.

Time-scale: Short-term

4.6.3 Energy efficiency in buildings

Residential, commercial and public buildings consume large amounts of energy, especially for cooling and lighting. To date, insufficient attention has been afforded to the design and energy performance of these buildings, or to construction components and materials. In fact, there are currently no regulations and/or standards in place directed towards thermal efficiency and energy end-use efficiency in buildings.

Action 34: The **Ministry in charge of Energy**, in collaboration with the Bureau of Standards, will encourage the application of building technologies and practices that enhance energy efficiency and conservation. For such purpose, the Bureau of Standards —preferably in collaboration with institutions in other Caribbean countries— will publish information on materials and components suitable for the construction of well-insulated buildings and the rehabilitation of existing buildings. It will disseminate such information among architects, civil engineers, construction companies, and the general public. It will also present guidelines for energy efficient building designs that lead to reduced cooling loads and improved day lighting, and issue instructions on how to properly insulate buildings against overheating, avoid cooling losses, use natural ventilation and install efficient lighting and air-conditioning systems.

Time-scale: Short-term

4.6.4 Energy efficiency in lighting

Lighting is one of the main areas of electricity consumption in the residential and

commercial sector. Despite activities to replace inefficient light bulbs by energy saving fluorescent lamps (e.g., through an initiative lead by the Government of Cuba in 2004), and tax incentives for the purchase of compact fluorescent lamps (CFLs), incandescent light bulbs continue to be sold and used in SVG. The European Union, Australia, and the United States are gradually banning the use and sale of incandescent light bulbs. Replacing them with more efficient lights may reduce electricity consumption for lighting by up to 80%, not considering the rebound-effect. In order to guarantee that consumers get only quality products, standards and certification systems, such as the Energy Star program in the United States, have been put in place in a number of countries, or are currently being discussed.

Action 35: The **Ministry in charge of Energy** will consider further fiscal incentives to encourage the use of energy efficient lighting devices, such as compact fluorescent light bulbs (CFLs) and light-emitting diodes (LEDs), and phase out the use of incandescent light bulbs. Through the Bureau of Standards, the Government will implement the necessary measures to prevent the import of low-quality CFLs. Such policy should be harmonized with steps taken in other countries of the region. The action must take place in parallel to information campaigns that provide details on the economic and environmental benefits derived from CFLs, and the aid provided by the Government through its **Ministry of Finance and Economic Planning**.

Time-scale: Short-term

4.6.5 Energy savings through solar water heaters

Hot water for private dwellings and large-scale consumers, such as hotels, restaurants and hospitals, can be produced almost exclusively through solar energy given SVG's climate conditions, thus avoiding the use of electricity, reducing peak loads and replacing the use of fossil energy, such as LPG. So far, the use of solar water heaters is limited mainly to part of the residential sector and to small tourism facilities.

Action 36: The **Ministry in charge of Energy** will bolster the introduction of solar water heaters in SVG and consider measures to reduce investment costs. For such purpose, it will enforce a regulation to exempt solar thermal collectors and related components from import duties, instead of the current case-by-case decisions. The **Ministry of Finance and Economic Planning** will further consider the provision of low-interest loans (e.g., through the state-owned Commercial Bank or VINLEC) or tax credits, in order to lower the burden of initial costs. For all new buildings with hot-water needs (in particular in the residential and service sector) the installation of solar thermal collectors will be made mandatory.

Time-scale: Short-term

4.6.6 Energy savings through energy efficient appliances

All of the major appliances sold or used in SVG are imported from overseas. There is low public awareness of the energy efficiency of those appliances, which can vary substantially between different manufacturers and products, even if the services provided by those appliances are comparable. In the United States, European Union, Japan, Brazil and many other markets, the use of labelling schemes for domestic appliances (like washing machines, air-conditioners, refrigerators, freezers etc.) and electronic office equipment (like monitors, personal computers, printers etc.), as well as setting the Minimum Energy Performance Standards and adequate certification of compliance is quite common and mandatory for a number of product types. Such labels give an indication about the grade of energy efficiency and inform the consumers about the energy consumption under defined conditions.

Action 37: The **Ministry in charge of Energy**, in collaboration with the **Bureau of Standards**, will enact legislation requiring that all major domestic appliances, such as refrigerators, freezers, washing machines, dishwashers and air conditioners, imported and sold in SVG carry a label stating their energy consumption and their compliance with predefined minimum energy performance standards. The labels shall comply with the rules of the European Appliance Labelling system, the United States Energy Star program, or any other reputable labelling scheme. Consideration will also be given to the banning of imports of products which do not fulfil minimum energy performance standards. Imports of goods that are not appropriately labelled or certified will be either forbidden or subject to extra taxation. The Ministry in charge of Energy, in collaboration with other Ministries and the Bureau of Standards, will analyse the current appliance market, harmonize actions with regard to labelling and determination of energy performance standards with other countries in the region, draft the necessary laws and regulations, and propose adequate public awareness activities. The new legislation shall be consistent with similar laws adopted by other countries of the region with the same purpose.

Time-scale: Short-term

4.6.7 Public sector energy efficiency measures

4.6.7.1 Government buildings

Government buildings as well as other public buildings can act as a showcase for modern energy efficient construction. It will also encourage other public institutions and local authorities to act accordingly in order to save financial resources.

Action 38: The **Ministry in charge of Energy**, through the Energy Unit, will set up an inter-ministerial energy efficiency programme that will undertake a comprehensive energy study of the of all Government owned/operated buildings, including ministries, post offices, police

stations, and health and educational facilities, among others. The study will identify the buildings to be audited, evaluate and analyse their current conditions, the various measures that could be implemented to reduce energy consumption and improve efficiency, and assess the buildings' energy supply through solar energy and/or small wind technology. New constructions and major refurbishments will be guided by the principle of low energy consumption for cooling, lighting and hot water needs. This includes the minimisation of artificial lighting to the extent necessary, the incorporation of shading, the use of natural air flow and the use of insulation materials in architectural designs.

Time-scale: Short-term

4.6.7.2 Public procurement

The Government and public institutions are major energy consumers. Together, they form a strong market force by purchasing electrical and electronic equipment as well as vehicles and other energy consuming devices. Public institutions funded by taxpayers have therefore a particular responsibility to use energy wisely and rationally, and to reduce its waste to the lowest level possible.

Action 39: The **Ministry in charge of Energy** will set rules for the procurement of all energy consuming goods and devices to be used by public institutions. Such rules will establish specific maximum energy consumptions. The Government will purchase and consume as much electricity and fuel as possible generated from indigenous renewable sources, therefore contributing to reduce dependence on imported fossil fuel. The reports of the energy efficiency studies of Government/Public buildings will be used to assist with the definition of such rules.

Time-scale: Short-term

4.6.7.3 Training and information of public staff

The lack, or insufficient knowledge, of how to efficiently handle equipment is a considerable cause of energy waste.

Action 40: The **Ministry in charge of Energy** and the public sector in its entirety shall implement public awareness campaigns aimed at promoting the rational use of energy and lower energy consumption. Energy conservation guidelines will be published. The SFA funded Energy Efficiency study of Government Buildings to be conducted in 2010 will deliver, as part of its scope of works, a Public Education and Awareness Program for Government employees.

Time-scale: Short-term

VI. Energy Action Plan Summary

<i>Policy</i>	<i>Sub-Policy</i>	<i>Actions</i>	<i>Time-frame</i>	<i>Implementing Body</i>
<p>4.1 <i>Planning and Management</i></p> <p>GOAL: <i>Consolidate well coordinated planning and management programmes to achieve sustainable supply and use of energy by 2015</i></p>	4.1.1 Institutional requirements	Action 1: Define responsible stakeholders with regard to energy issues.	ST	Cabinet
	4.1.2 Energy data base and publication of annual energy statistics	Action 2: Establish a system to retrieve up-to-date information	ST	Office of Statistics
	4.1.3 Capacity Building, Education and Awareness Raising	Action 3: Implementation of energy-related training at all education levels from primary schools up to college courses. It will further provide financial means for advanced professional training.	ST	Ministry of Education
	4.1.4 Pilot and Demonstration Projects	Action 4: Set up a fund in support of small-scale pilot and demonstration projects in that showcase new ways to enhance energy efficiency.	ST	Ministry in charge of Energy
		Action 5: Ensure that the new International Airport on St. Vincent will be built in the most energy efficient manner possible	ST	Ministries in charge of Energy and the International Airport Development Company
	4.1.5 Interconnection	Action 6: Investigate opportunities for electrical interconnection between different islands of the country and with neighbouring states and take notice of results from studies being developed by international organisations.	LT	Ministry in charge of Energy and VINLEC
	4.1.6 Environmental Impact Assessment (EIA)	Action 7: Establish guidelines including requirements and standards of EIA for any new energy project	ST	Ministry in charge of Environment
	4.1.7 International cooperation and financing	Action 8: Strengthen contact with international donor and financing institutions to access funding sources for energy efficiency and renewable energy measures and investments.	ST	Ministry in charge of Energy
4.1.8 Financial incentives	Action 9: Select items that will be completely or partially exempted from import or consumption taxes	ST	Ministry of Finance and Economic Planning	

Energy Action Plan for St. Vincent and the Grenadines – First Edition

	4.1.9 Monitoring and Evaluation	Action 10: Report biannually on the status and results, and further revise the EAP accordingly if required to meet the overall energy targets or to adapt to new political conditions.	ST (LT continuance)	Ministry in charge of Energy, other relevant Ministries, public institutions and VINLEC
4.2 Power Sector GOAL: <i>Reduce projected increase in peak demand by 5% by 2015 and 10% by 2020, and strive to reduce power losses down to a total of 7% by 2015 and 5% by 2020.</i>	4.2.1 Long-term planning for the electricity sector	Action 11: Elaborate and review at biennial intervals a 10-year planning prospects for the electricity sector	ST (LT continuance)	VINLEC
	4.2.2 Tariff Structures	Action 12: Derive a more equitable formula for imposing the demand charge, in particular for the commercial sector. Review the tariff structures to better reflect real costs	ST	VINLEC
	4.2.3 Demand side Management	Action 13: Offering low- or no-cost services for energy audits to major electricity consumers. Set up an information and advisory centre and elaborate adequate publications for smart and cost-saving energy use.	MT	Ministry in charge of Energy and VINLEC
4.3 Renewable Energy GOAL: <i>Deliver 30% of projected total electricity output from Renewable Energy Sources (RES) by 2015 and 60% by 2020</i>	4.3.1 Technologies			
	4.3.1.1 Geothermal	Action 14: Ensure sustainable development of exclusive geothermal exploration and exploitation in the Soufriere Resource Area on mainland St. Vincent	ST	Ministry in charge of Energy
	4.3.1.2 Hydro Power	Action 15: Select appropriate river sites for possible future hydro power plants and start a long-term gauging programme.	ST to LT	VINLEC / NWRMSP CREDP
Action 16: Provide the financial means for the rehabilitation of the hydro power plants at South River and Richmond and for the installation of new small hydro power plants.		ST to MT	VINLEC	

Energy Action Plan for St. Vincent and the Grenadines – First Edition

	4.3.1.3 Wind Energy	Action 17: Execute further long-term wind measurements on Vincent. Examine ground conditions for turbine foundations to assess EIA, technical and pre-feasibility studies.	ST	VINLEC, CREDP
		Action 18: Erection of wind turbines and posts for grid-connection. Land use planning, dedicating and reserving sites for the construction of additional future wind farms.	ST (LT continuance)	Ministry for Physical Development and VINLEC
	4.3.1.4 Biomass Energy and Waste-to-Energy	Action 19: Analyse the energetic potentials from agricultural, forestry and food-processing sector, of organic waste material and of dedicated energy plants.	ST	Ministry of Agriculture, Forestry and Fisheries
	4.3.1.5 Solar Electricity and Solar Thermal Use	Action 20: Analyse market potentials for the (extended) application of solar thermal and solar electric systems in all consumption sectors. Install a pilot photovoltaic plant and publish technical guidelines for the interconnection of small grid-connected RE systems.	ST	Ministry in charge of Energy, VINLEC
	4.3.2 Applications			
	4.3.2.1 Renewable energy for the Grenadine islands	Action 21: Investigate opportunities to tap cost-efficiently wind and solar potentials for electricity generation. Provide support of private power operators on initiatives to replace diesel fuel by alternative energy sources.	ST	Ministry in charge of Energy
	4.3.2.2 Renewable energy for self supply	Action 22: Investigate opportunities for the installation of stand-alone PV and wind power systems.	ST	Ministry in charge of Energy, VINLEC
	4.3.3 Stimulus Tools			
	4.3.3.1 Independent Power Production	Action 23: Amend the Electricity Supply Act or mandate a sub-licence for electricity generation activities.	ST	Ministry in charge of Energy, VINLEC
	4.3.3.2 Net metering	Action 24: Determine conditions for feed-in of excess electricity and support of back-up and reserve power. Create an Act to introduce "Net-metering"	ST	Ministry in charge of Energy
4.4 Petroleum Sector GOAL: Increase energy security and diversify the energy portfolio	4.4.1 Contracts and agreements for energy supply and storage	Action 25: Strengthen bilateral relationships with energy supplying countries within and external to the region, such as the contract on petroleum supply "PETROCARIBE agreement".	ST (LT continuance)	Ministry of Foreign Affairs, Commerce & Trade
	4.4.2 Petroleum reserve storage	Action 26: Revise existing regulations or propose parliament respective legislation to make provisions for ensuring adequate inventory levels exists to cushion any disruption in supply of petroleum derivatives	MT	Ministry of Foreign Affairs, Commerce & Trade

Energy Action Plan for St. Vincent and the Grenadines – First Edition

	4.4.3 Diversification of Energy Sources	Action 27: Reduce reliance on a single fuel type for the generation of electricity and heat and for the transport sector. Natural gas and RE sources are among the alternatives which will be further explored. Investigation on electrical interconnection between different islands of the country and with neighbouring states	ST and LT	Ministry in charge of Energy and VINLEC
4.5 Transport Sector GOAL: Reduce projected consumption of fossil fuels in the transport sector by 10% by 2015 and 15% by 2020	4.5.1 Reduced Fuel Consumption of Vehicles	Action 28: Advise the public on specific fuel consumption of different car models that are commonly imported. Revise the car taxation system. Subsidize the public transport sector as to stimulate the use of more low-consuming vehicles.	ST	Ministry in charge of Energy, Ministry of Finance and Economic Planning, and Bureau of Standards
	4.5.2 Transport Strategy	Action 29: Develop a comprehensive long-term transport strategy.	MT to LT	Ministry of Transport & Works
		Action 30: Study the potential of introducing electric vehicles in the island.	MT to LT	The Ministry in charge of Energy and VINLEC
	4.5.3 Biofuels for Transport	Action 31: Study the options to either import biofuels from countries such as Brazil or set up a national production chain.	ST	The Ministry in charge of Energy
4.6 Energy Efficiency GOAL: Reduce projected electricity generation by 5% by 2015 and 15% by 2020	4.6.1 Assessment of Market Potential	Action 32: Investigate how the energy consumption sector is structured and what potentials exist for improving energy efficiency.	ST	Ministry in charge of Energy, VINLEC
	4.6.2 Co-generation	Action 33: Support activities that contribute to higher energy efficiency. Provide legal basis for the parallel operation of co-generation plants with the public grid. Determine conditions for feed-in of excess electricity and support of back-up and reserve power	ST	Ministry in charge of Energy, VINLEC
	4.6.3 Energy efficiency in Buildings	Action 34: Publish guidelines for the construction of energy efficient and well-insulated building designs, as well as rehabilitation of existing buildings.	ST	Bureau of Standards
	4.6.4 Energy efficiency on lighting	Action 35: Support households to make a switch from incandescent light bulbs to compact fluorescent light bulbs	ST	Ministry in charge of Energy
	4.6.5 Energy savings through solar water heaters	Action 36: Enforce a regulation to exempts solar thermal collectors and related components from import duties, low-interest loans or tax credits	ST	Ministry in charge of Energy

Energy Action Plan for St. Vincent and the Grenadines – First Edition

	<p>4.6.6 Energy savings through energy efficient appliances</p>	<p>Action 37: Enact that all major domestic appliances carry a label stating their energy consumption or compliance with defined Minimum Energy Performance Standards</p>	<p>ST</p>	<p>Bureau of Standards</p>
<p>4.6.7 Public Sector Energy Efficiency measures</p>				
	<p>4.6.7.1 Government Buildings</p>	<p>Action 38: Undertake a comprehensive energy study of the highest energy consuming Government owned/operated buildings to reduce the energy consumption and improve the indoor environment of these buildings and also evaluate the option to supply the buildings' energy needs by solar energy technology.</p>	<p>ST</p>	<p>Energy Unit</p>
	<p>4.6.7.2 Public Procurement</p>	<p>Action 39: Set rules for the procurement of all energy-consuming goods and devices used for their own purpose as well as for any other public institution. Purchase and consume as much electricity and fuel possible from indigenous renewable sources</p>	<p>ST</p>	<p>Ministry in charge of Energy</p>
	<p>4.6.7.3 Training and Information of Public Staff</p>	<p>Action 40: Information campaigns to better manage the use of energy and thus lower energy consumption. Guidelines will be published on how to save electricity.</p>	<p>ST</p>	<p>Ministry in charge of Energy</p>
